## **New Classes of "Emerging" Pollutants**

- During the meeting held on-line last September 22, 2021, we focused our attention on some classes of "emerging pollutants", such as PPCPs
- Going on about taking care of environment, as well as caring about our food, in this occasion we will try to get a sort of second order emergence.
- Indeed, if PFAS are included in the list of emerging contaminants, recently there is an increasing interest for "emerging PFAS", that become "emerging-emerging".
- Beyond the commonly monitored "traditional PFAS", we need new, untargeted approaches for their identification.

## Traditional and Emerging PFAS: Who Concern

- PFAS are widely employed in several fields, such as domestic use items, medical devices, paper and general packaging materials, fabrics manufacturing, automotive, and so on...
- They are a critical issue for environment.
- They are as well a very critical issue for their presence in food.
- Indeed, a lot of PFAS-containing materials bump into food: food packaging, cookware (for instance, non-stick pans), single use plates, glasses and silverware (materials later released in the environment...)
- Food packaging, hence, become a sort of link between environment and food safety

## Food Contact Center - Pistoia- Tuscany

### Analytical techniques

(some techniques are available thanks to synergies with partner laboratories)

- Gravimetric analysis, GC FID-MS and LC-MS. Metal analysis ICP OES, ICP MS
- UV VIS spectrometry, infrared spectrophotometry with ATR and microscope
- Mechanical analysis of bending, traction and compression
- DSC-TGA thermal analysis
- GPC for molecular weight analysis of polymers
- Optical microscopy, X-ray diffraction
- SEM with EDXS microanalysis
- Permeability to various gases
- Sensory analysis
- Devices for the evaluation of technological compliance

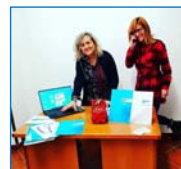

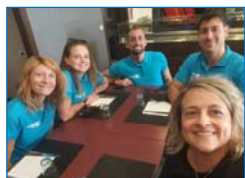

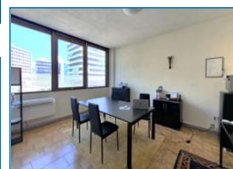

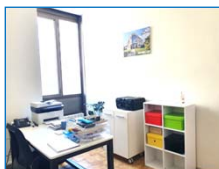

All operations and office processes in the Food Contact Center are managed through **LIMS** (Visual Lims- Infoteam)

### Agenda

- ☐ PFAS: definition and uses in FCM
- ☐ Testing approach, sample preparation for different Items and PFAS
- ☐ Hidden PFAS in paper food contact materials: untargeted screening of perfluoroalkyl substances and Total Oxidizable Precursor Assay

## FCM: Food Contact Materials

The main purpose of packaging:

- Protect
- Preserve
- Promote the product on the market.

**The final packaging is very important...**

But we must not underestimate the risk related to **industrial packaging and surfaces, cooking/kitchen materials!**

## FCM: Food Contact Materials

The European Legislation on Food Contact Materials is based on the framework Regulation (EC) No 1935:2004.

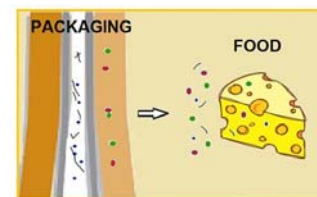

This Regulation establishes the **general requirements** for food contact materials and the authorization of new substances.

Regulation (EC) No. 1935:20041 includes the following requirements:

Food contact materials:

Must be safe.

Must not **transfer their components into food in quantities that could endanger human health**, change food composition in an unacceptable way or deteriorate its taste and odour.

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

## FCM: Food Contact Materials

**in quantities** that.... ?

**Risk evaluation**

**Risk assessment**

**Risk management**

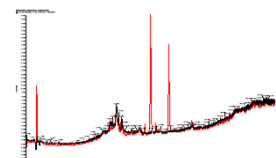

**Risk evaluation:**

**Hazard** = any source of potential adverse health effect, harm or damage (in our case it refers to the toxicity of substances)

**Exposure** = the extent to which someone is subjected to a hazard

**Risk** = the likelihood that a person exposed to a hazard will be harmed

**MIGRATION TESTING**

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

## FCM: Food Contact Materials – Migration testing

+

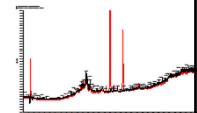

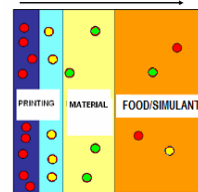

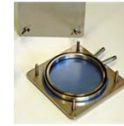

Hazard (toxicity)

No exposure = No Risk

Hazard + exposure = RISK

### MIGRATING SUBSTANCES

- **IAS** (Intentionally Added Substances): specifically added during the manufacturing process of materials, having a function in the manufacturing process or in the final product.
  - Raw materials – starting substances
  - Monomers
  - Additives
  - Solvents
  - Colourings
- **NIAS** (Non intentionally added substances): impurities in the substances used, reaction intermediate formed during the production process, or products of reaction or decomposition.
  - Additives degradation
  - Polymer degradation
  - Residues
  - Neoformed products
  - Impurities

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

More than 4500 manufactured substances that meet the definition of PFAS

- Perfluoroalkylated (PFAS) substances consist of a large group of substances a fully fluorinated hydrophobic alkyl chain of varying length (4-16 C atoms) and a hydrophilic end [R, F(CF<sub>2</sub>)<sub>n</sub>R]
- Within PFAS groups, two major substances are reported and studied: Perfluorooctanoic acid (PFOA) and Perfluorooctane sulfonic acid (PFOS):
- PFOA - C<sub>8</sub>HF<sub>15</sub>O<sub>2</sub>
- PFOS - C<sub>8</sub>F<sub>17</sub>SO<sub>3</sub>-
- PFAS have high compound stability.
- PFAS are bioaccumulative, persistent and toxic.

Abstract

**Background:** Per- and polyfluoroalkyl substances (PFAS) have uniquely useful chemical and physical properties, leading to their extensive industrial, commercial, and consumer applications since at least the 1950s. Some industries have publicly reported at least some degree of information regarding their PFAS use, while other industries have reported little, if any, such information publicly.

**Methods:** Publicly available sources were extensively researched for information. Literature searches were performed on key words via a variety of search mechanisms, including existing PFAS use and synthesis literature, patent databases, manufacturers' websites, public government databases, and library catalogs. Additional searches were conducted specifically for suspected or known uses.

**Results:** PFAS have been used in a wide variety of applications, which are summarized into several industries and applications. The expanded literature search yielded additional references as well as greater details, such as concentrations and specific PFAS used, on several previously reported uses.

**Conclusions:** This knowledge will help inform which industries and occupations may lead to potential exposure to workers and to the environment.

*Carbon tetrafluoride, the simplest perfluorocarbon, was first produced in 1886. Other PFCs have been made since at least the 1930s. PFAS with functional groups have been made since at least the 1940s and since at least the 1950s have been used in various industries and products due to their unique properties. The first fluoropolymer patent was filed in 1934. Polytetrafluoroethylene (PTFE) was first synthesized in 1938, and due to its unique properties, was used in the Manhattan Project to separate UF<sub>6</sub> isotopes. In 1946, DuPont commercialized PTFE.*

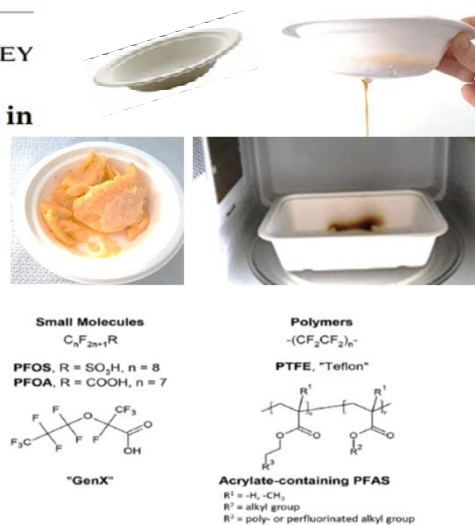

FIGURE 1 Chemical structure of selected PFAS

## Regulatory Enforcement

L 372/32

EN

Official Journal of the European Union

27.12.2006

### DIRECTIVE 2006/122/EC OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 12 December 2006

amending for the 30th time Council Directive 76/769/EEC on the approximation of the laws, regulations and administrative provisions of the Member States relating to restrictions on the marketing and use of certain dangerous substances and preparations (perfluorooctane sulfonates)

(Text with EEA relevance)

Early studies focused on perfluoroalkyl acids (PFAA), like perfluorooctane sulfonic acid (PFOS) and perfluorooctanoic acid (PFOA).

In 2006 the European Commission limited the use of these substances, in the same year US EPA launched a global stewardship program inviting companies to reduce PFOA. Following these regulations that limited their use, industries searched for alternative fluorinated compounds, like perfluoroalkyl sulfonates and perfluoroalkyl ether carboxylic acids (e.g., GenX, ADONA and F-53B)

In 1999, Robert Bilott sued E.I. du Pont de Nemours and Co, better known as DuPont, on behalf of a West Virginia farmer whose cows were dying. Over the course of that lawsuit, Bilott discovered that DuPont had been using a chemical called PFOA in the production of Teflon for decades, while quietly studying its effects on lab animals and factory workers.

## Regulatory Enforcement on FCM

August 5, 2021

Dear Manufacturers, Distributors, and Users of Fluorinated Polyethylene Food Contact Articles:

The U.S. Food and Drug Administration (FDA) is directing this letter to manufacturers, distributors, and food manufacturers that use fluorinated polyethylene food contact articles as a reminder that only certain fluorinated polyethylene containers are authorized for food contact use. Specifically, FDA's regulation authorizing the use of fluorinated polyethylene in contact with food is listed in Title 21 of the Code of Federal Regulations Part 177.1615 (21 CFR 177.1615).<sup>1</sup> This regulation stipulates that fluorinated polyethylene containers for food contact use may only be manufactured by modifying the surface of the molded container using fluorine gas in combination with gaseous nitrogen as an inert diluent. The regulation does not authorize fluorination in the presence of water, oxygen, or gases other than nitrogen.

COMMISSION REGULATION (EU) 2021/1297  
of 4 August 2021

amending Annex XVII to Regulation (EC) No 1907/2006 of the European Parliament and of the Council as regards perfluorocarboxylic acids containing 9 to 14 carbon atoms in the chain (C9-C14 PFAs), their salts and C9-C14 PFCA-related substances

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

News 3  
13.09.2021  
REGULATION  
Released by  
California Legislature

### CALIFORNIA LEGISLATURE PASSES BILL TARGETING PFAS IN FOOD PACKAGING AND COOKWARE

The bill prohibits the sale of plant fibres-based food packaging that contains PFAS that has been intentionally added to have a functional or technical in the product, or is present in the product at or above 100 parts per million

The California legislature passed AB 1200, known as the California Safer Food Packaging Cookware Act of 2021, on September 7, 2021, and was enrolled and presented to the governor for signature on September 13, 2021. The bill bans the use of perfluorinated and polyfluorinated alkyl substances (PFAS) in food packaging composed in substantial part of paper, paperboard, or other materials derived from plant fibres. It also requires warning labels on cookware to which PFAS was intentionally added. Similar to other state laws on PFAS in food packaging, the California bill defines PFAS as "fluorinated organic chemicals containing at least one fully fluorinated carbon atom." It also requires, as of January 1, 2024, manufacturers of cookware that contains any chemical on the state's Green Chemistry list of chemicals of concern to list the presence of those chemicals on the product label, and to post this information on the internet, along with a link to the authoritative lists for the relevant substances.

THE PEOPLE OF THE STATE OF CALIFORNIA DO ENACT AS FOLLOWS:

SECTION 1. Chapter 12.5 (commencing with Section 108945) is added to Part 3 of Division 104 of the Health and Safety Code, to read:

CHAPTER 12.5. Juvenile Products

108945. For purposes of this chapter, the following definitions apply:

(a) "Adult mattress" means a mattress other than a crib mattress or toddler mattress.

(b) "Regulated perfluoroalkyl and polyfluoroalkyl substances" or "regulated PFAS" means either of the following:

(1) PFAS that a manufacturer has intentionally added to a product and that have a functional or technical effect in the product, including, but not limited to, the PFAS components of intentionally added chemicals and PFAS that are intentional breakdown products of an added chemical that also have a functional or technical effect in the product.

(2) The presence of PFAS in a product or product component at or above 100 parts per million, as measured in total organic fluorine.

## LIMIT ON TOTAL FLUORINE...

### Ban on fluorinated substances in paper and board food contact materials (FCM)

#### Indicator value

The Danish Veterinary and Food Administration has introduced an indicator value that can help the industry assess whether organic fluorinated substances have been added to paper and board. The indicator value is **20 microgram organic fluorine per gram of paper**. This corresponds to 10 microgram organic fluorine per square decimeter of paper, when the paper has a weight of 0.5 gram per square decimeter. Content below the indicator value is considered as unintentional background pollution. So, companies can use the value to ensure that organic fluorinated substances have not been added to the paper.

Home - Certification - Fluorinated Chemicals (PFAS)

### Fluorinated Chemicals (PFAS)

The BPI Certification Scheme states that organic fluorinated chemicals, such as perfluorinated and polyfluorinated substances, cannot be present in formulas for BPI Certified items. BPI's rules for fluorinated chemicals are as follows:

- 1) The product formula must not contain fluorinated chemicals — as evidenced by safety data sheets for all ingredients.
- 2) Test results from a BPI-Approved lab showing a maximum of 100ppm total organic fluorine.
- 3) A statement of no intentionally added fluorinated chemicals, signed by the manufacturer.

Statement... declaration of NON INTENTIONAL USE

### 8.1.4. Chemical characteristics

As specified in EN 13432 the total Fluorine concentration of the product must not exceed 100ppm. To further restrict the use of per-fluorinated or fluorinated chemicals each applicant must sign a self-declaration that no PFAS (as defined by the OECD, see §12.4.) are added to their product.

## Alerts on the packaging market

**“Pfas” testing?  
TOF testing!**

### Fluorinated compounds

Of the 41 products analysed for fluorinated compounds, 27 (66%) exceeded the Danish indicator value. The highest concentration of organic fluorine measured was 2,800 mg/kg – or 140 times above the indicator value. All the moulded fibre products – as well as some paper straws – exceeded the indicator value. These results thus suggest that fluorinated compounds were used, for example to make the products water- and/or fat repellent. Seven paper straws contained organic fluorine close to the reference value; indicating that fluorinated compounds were either used intentionally in printing inks or were present as a contaminant at high levels in e.g. recycled materials.

The present test did not explore the presence of specific PFAS compounds in the sampled SUP alternatives. Previous investigations have however identified specific PFAS compounds in paper and board food packaging through combined use of TOF analysis and targeted methods. In 2017, five consumer organisations detected<sup>23</sup> the presence of PFOA and its six-carbon cousin compounds perfluorohexanoic acid (PFHxA) and perfluorobutanoic acid (PFBA) in 31 paper samples; all exceeding the Danish TOF indicator value. Recent U.S. research<sup>24</sup> measured both short- and long-chain PFAS compounds in 36 out of 38 paper and other plant-based straws. Among the most frequently detected compounds in that study were also PFOA, PFBA, and PFHxA. Migration analysis showed that approximately two-thirds of the total extractable PFAS leached from the paper straws into cold water.

Targeted analysis is only able to detect those PFAS compounds for which analytical standards are available; thousands of PFAS are in commercial use, however, implying that targeted analyses are prone to ‘overlook’ many compounds present in the food packaging material. For example, a recent European wide investigation<sup>25</sup> by eight civil society organisations found that targeted analysis could assign less than 1% of the total organic fluorine present in sampled disposable food packaging and tableware to the investigated 55 PFAS compounds. TOF analyses in contrast can detect all PFAS, including unknown precursor compounds, and typically also operates with lower limits of detection. Researchers at the Danish Technological University have thus concluded that these methods are suitable for non-targeted detection of PFAS in paper and board material.<sup>26</sup>

The test investigated the presence of fluorinated compounds in paper straws and the moulded fibre products (41 total samples). The TOF analysis was performed through a modified version of European standard DIN EN ISO 10304-1 (D20). In the analysis the material is burned, and the organic fluorine converted to hydrogen fluoride which is then collected in a liquid that removes inorganic fluoride and thereafter analysed with ion chromatography.

*Il test che ha condotto per il Salvagente il professor Massimo Chiari, come abbiamo anticipato, **non misura i Pfas specifici**. La tecnica che ha usato nel suo laboratorio dell'Infn si chiamava “Emissione di raggi gamma indotta da particelle” (Pige), e può determinare la quantità totale di fluoro in un certo prodotto.*

*Attualmente, del resto, sono **4.730** le molecole censite che fanno parte della famiglia dei per-fluoro-alchilici, di varia natura, a catena lunga e catena corta. **Sarebbe stato complicato** testare ogni sostanza per definire precisamente l'elemento utilizzato.*

## PFAS in FCM: sample preparation and targeted&untargeted testing

*“Currently, moreover, 4,730 molecules are surveyed that are part of the family of per-fluoro-alkyls, of various kinds, with long and short chains. It would have been complicated to test each substance to precisely define the compound used”*

Sometimes, also with untargeted testing LC Q TOF, we do not detect PFAS content in paper samples having total fluorine > 1000 ppm

Supporting Information

One explanation for these findings is that much of the total fluorine in these samples was present as inorganic fluorine or non-PFAS organofluorine compounds....

Another explanation is that our extraction and LC/TOF MS analyses failed to capture a substantial portion of the PFASs present in the samples. For instance, FTOHs have been among the most frequently detected PFASs in FCMs,<sup>43</sup> but they are volatile and form adducts with LC modifiers, making their measurement erratic as determined by LC/MS.

## PFAS in FCM: sample preparation and targeted&untargeted testing

Quoted from CEN/TS 15968:2010

This document has been prepared under a mandate given to CEN by the European Commission and the European Free Trade Association and supports essential requirements of REACH (1907/2006), annex XVII, designation 53 [1]

### Procedure

### 5 Principle

The analytes listed in Table 1, after extraction with methanol, are determined by liquid chromatography with tandem mass spectrometric detection (LC-tandemMS) or liquid chromatography mass spectrometric detection (LC-qMS). The list of analytes is not comprehensive for all possible PFOS derivatives.

### Polyfluorinated surfactants in food packaging of paper and board

By Xenia Trier

**Supervisors:**  
Jan H. Christensen, Ass. Professor, KU-LIFE  
Kjet Granby, Senior Researcher, DTU-Food

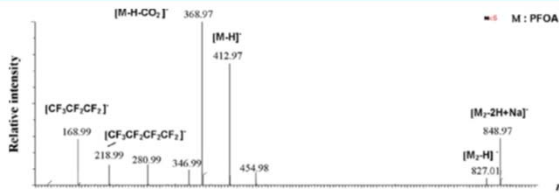

### 5. Migration of PFS from food paper and board

The use of PFS in paper and board packaging is of interest from a food safety point of view (Forrest 2007), because the consumer has a high risk of exposure, as mentioned in the Introduction. Briefly, these include that food paper and board packaging has a European market share of approximately 20% (Lange et al. 2006, van der Putte et al. 2010); that the packaging is single-use; due to the relatively high initial concentrations of PFS, and because several of the PFS are small molecules, which give them a higher potential to be transferred (i.e. migrate) to the food.

To better understand the migration behaviour of PFS from paper and board into food and beverages, this chapter describes the paper and board material (5.1), why and how PFS are used in paper and board (5.2), the theories behind migration processes (5.3), European and US legislation (5.4), and choice of migration conditions for compliance and enforcement testing (5.5). Finally, the results of a survey made on PFS from 74 samples of paper and board sampled in 2009 from Danish, Swedish and Canadian fast food and retail stores are presented (paper 8).

## PFAS in FCM: sample preparation and targeted&untargeted testing

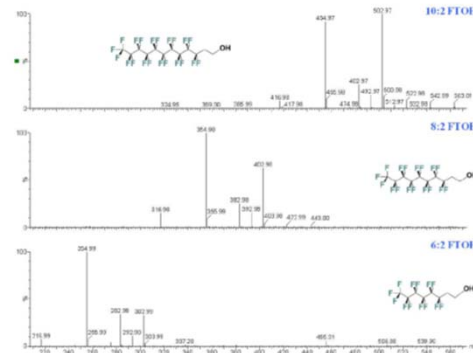

Negative-ion electrospray ionisation (ESI-) coupled to mass spectrometry (MS) is a popular detection method for the smaller anionic poly- and perfluorinated surfactants (PFS), such as the PFCAs. So far, the FTOHs have mainly been analysed by gas chromatography (GC)-MS, but GC is not suitable for the analysis of residual FTOHs in the fluoropolymers, both because thermal degradation of the polymers can form artefact FTOHs3 and because polymers often are not sufficiently volatile for GC.

Common name

FTOH

### MIGRATION OF FLUORINATED TELOMER ALCOHOLS (FTOH) FROM FOOD CONTACT MATERIALS INTO FOOD AT ELEVATED TEMPERATURES

Feigler R, Schlummer M, Gruber L, Fiedler D, Weise N

Fraunhofer Institute for Process Engineering and Packaging IVV, Dep. Products Safety and Analysis, Gitzgenhauser Str. 35, D-85354 Freising, Germany

#### Materials and methods

At first, fluorine-positive muffin papers were identified by using sliding spark spectroscopy and Headspace GC-EL-MS as described elsewhere<sup>2</sup>. Then, methanol extracts of the muffin papers were subjected to FTOH specific analysis based on GC/EL-MS<sup>3</sup> and quantified with isotope-labeled standards of 4:2-, 6:2-, 8:2- and 10:2-FTOHs.

## PFAS in FCM: a case History

PFAS in FCM: a case History

The environmental impact categories closest to stakeholder interest are **Global Warming** (CO<sub>2</sub> contributions) and **Water Footprint**. The **bagasse pulp** provides a **very high** contribution to **Global Warming** because its production involves an intense use of energy. The use of **water**, on the other hand, is **lower** because bagasse is a **waste** from the processing of sugarcane\*.

LCA results:

VIQ HUJ \ #JIVN #D VVHVVP HQ W# #GHFIVIR Q #P DNIQ J #

■ PP tray

■ Bagasse tray

\*the use of water is allocated to the sugarcane production and not to the bagasse waste

**Carbon and Oxygen ratio tipycal of Cellulose**

**Internal SEM: structure similar to Viscose...**

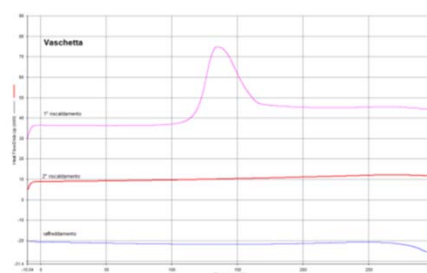

**Figura 4:** Spettro FT/IR-ATR del campione di vaschetta. Lo spettro è attribuibile a quello della sola cellulosa, non si osservano bande di assorbimento attribuibili ad altre componenti organiche/inorganiche.

**FT IR and DSC typical of Cellulose**

Una frazione del campione di vaschetta è stata sottoposta ad **analisi DSC** impiegando il seguente programma termico:

- I° riscaldamento da -10 °C a 300 °C, 20 °C/min in N₂
- Raffreddamento da 300 °C a -10 °C, -20 °C/min in N₂
- II° riscaldamento da -10 °C a 300 °C, 20 °C/min in N₂

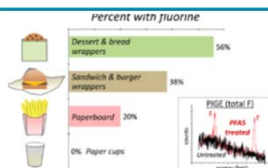

In Figura è riportato il termogramma DSC ottenuto.

**Figura** Termogramma DSC per il campione di vaschetta. L'analisi DSC mostra, per il campione di vaschetta, solo una fusione nel primo riscaldamento dovuto alla cellulosa (linea rosa in Figura 3), non sono evidenti altre transizioni termiche nel secondo riscaldamento (linea rossa in Figura 3).

## PFAS in FCM: a case History

### Fluorinated Compounds in U.S. Fast Food Packaging

Laurel A. Schaidt,<sup>1</sup> Simona A. Balan,<sup>2</sup> Arlene Blum,<sup>3,4</sup> David Q. Andrews,<sup>1</sup> Mark J. Strynar,<sup>5</sup> Margaret E. Dickinson,<sup>6</sup> David M. Lunderberg,<sup>7</sup> Johnnie R. Lang,<sup>8</sup> and Graham F. Peaslee<sup>9</sup>

However, some samples with high levels of total fluorine according to PIGE did not contain elevated levels of PFASs according to LC/MS analyses.

Four samples with a total F concentration of >200 nmol/cm<sup>2</sup> contained peak areas for known and/or unknown PFASs that were at or below levels detected in six samples with a total F concentration below the LOD. **One explanation for these findings is that much of the total fluorine in these samples was present as inorganic fluorine or non-PFAS organofluorine compounds.** Another explanation is that **our extraction** and LC/TOF MS analyses failed to capture a substantial portion of the PFASs present in the samples. ....

**Total  
Oxidizable  
Precursors  
Assay**

## PFAS in FCM: a case History

### Many Literature Papers....

When the samples with high total fluorine were tested for 28 specific PFAS in Phase 2, these 28 PFAS did not appear in most cases. This indicates that other members of the PFAS family are responsible for the Phase 1 results. A TOPA analysis confirmed the likely presence of unknown PFAS 'precursors' and other 'polymeric' PFAS. While the identity of these unknown PFAS cannot be easily determined, unidentified PFAS should be treated in the same way as known PFAS and steps taken to transition them out of packaging.

## PFAS in FCM: a case History

•Screening in LC/QTOF dopo idrolisi basica, e screening LC/QTOF dopo trattamento con Permanganato di Potassio.

Per "attaccare" le catene di composti fluorurati in maniera mirata, dopo confronto con specialisti di materiali e analitica, sono state programmate analisi previo pretrattamento.

**L'analisi TOP (Total Oxidizable Precursors) si basa sull'ossidazione della matrice in analisi.**

Nel caso in cui all'interno della matrice siano presenti dei precursori di composti perfluorurati, il trattamento con un agente ossidante porta alla loro conversione in acidi perfluorocarbossilici o perfluorosolfonici, i quali possono essere determinati successivamente mediante analisi mirate.

L'analisi TOP consente la determinazione semi-quantitativa degli analiti ricercati poiché risulta difficile ottenere un'ossidazione riproducibile di tali composti a causa della possibile presenza nel campione di altre sostanze che possono prevenire l'ossidazione dei composti bersaglio, influenzando così l'identificazione dei precursori e l'accurata quantificazione dei PFAS nascosti.

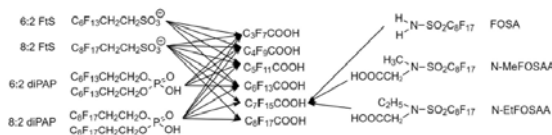

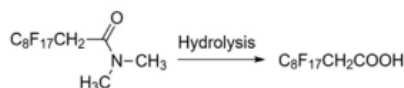

Fig1. Formazione dei prodotti di ossidazione a partire da diversi precursori (Houtz e Sedlak, 2012).

**L'analisi THP "Total Hydrolyzable Precursors" invece prevede il trattamento del campione con metanolo e idrossido di sodio** con lo scopo di idrolizzare i precursori dei PFAS. Lo studio dei database disponibili mostra che gran parte dei composti organofluorurati brevettati sono dei derivati di semplici PFAS con l'aggiunta di un legame con l'atomo ossigeno, come ad esempio i polimeri con catene laterali di fluorotelomeri.

È noto che i legami esterei che si vengono a formare sono suscettibili all'idrolisi la quale porta alla liberazione dei rispettivi acidi perfluorocarbossilici o perfluorosolfonici che possono a questo punto essere analizzati mediante analisi target.

In conclusione l'analisi TOP e l'analisi THP possono costituire dei metodi alternativi e complementari per valutare i PFAS nascosti.

## Risk Assessment on food contact materials

"I would like to be honest here... I have tested my products in different labs, and for same services I obtained very different results....."

Customers

Can we manage this situation?  
Can we do something to harmonize testing, defining standard protocols, supported by statistical analysis?

[www.proficiencyproblemsolving.com](http://www.proficiencyproblemsolving.com)

## OUR MANIFESTO

Sometimes in analytics and in testing we face problems that seem to be difficult to solve.

We strongly believe that the best way to approach such cases is **statistical problem solving**.

### TWO MAIN REASONS:

- «robust» answers to complex problems
- lower costs and less time to get solutions

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

[www.proficiencyproblemsolving.com](http://www.proficiencyproblemsolving.com)

### ABOUT US:

- We are a **NET of professionals working in different organizations** like Universities, Accredited Labs, National Accreditation Bodies, Public and Private Companies.
- We started years ago **sharing technical and analytical problems, knowledge and solutions** - by the years we created an «**informal NET**».
- The majority of **our works are reserved** and cannot be published, due to the confidentiality agreements, but still **we can share a great number of «lessons learned»**.
- In 2017 we decided to make the informal net **visible through a web site** and open it to contribution from other colleagues.

[www.foodcontactcenter.com](http://www.foodcontactcenter.com)

[www.proficiencyproblemsolving.com](http://www.proficiencyproblemsolving.com)

#### TOOLS:

- We work **by projects** and every project has its own **team of professional** selected for the specific topic.
- The setting of the project always refers, when possible, to legislation and applicable standards (e.g. for interlaboratory studies we refer to ISO 17043 and ISO 13528).
- When samples are requested, as for interlaboratory trial, we provide **real samples** coming from industrial productions.
- **Anonymity of participants** in interlaboratory trials is covered by a **software specifically designed**.

*Sensitive PFAS analysis from Edible Produce on Xevo  
TQ-XS after QuEChERS extraction*

# **Sensitive PFAS analysis from Edible Produce on Xevo TQ-XS after QuEChERS extraction**

*Andrea Perissi, MS Sales Specialist – Waters*

Environmental release and contamination of per- and polyfluorinated alkyl substances (PFAS) has resulted in contamination of a variety of food sources. Different type of commodities needs different approach.

Cultivating produce using PFAS contaminated water and soils can lead to the uptake of these compounds into the edible fruits and vegetables portions of plants. Thus, it is beneficial to have a straightforward method to monitor the occurrence of PFAS in produce. For this work, the FDA C-010.01 method based on the QuEChERS extraction method was implemented for extraction of PFAS using DisQuE dispersive solid phase extraction (dSPE) products followed by highly sensitive LC-MS/MS analysis on ACQUITY UPLC I-Class PLUS coupled to Xevo TQ-XS.

Complex food commodities such as fish, meat, edible offal, and eggs require a comprehensive sample extraction and clean up. To accommodate these types of samples, an alkaline digestion and extraction was implemented followed by Weak Anion Exchange (WAX) SPE to produce a suitable sample for analysis. High sensitivity LC-MS/MS analysis was performed on an ACQUITY UPLC I-Class PLUS coupled to Xevo TQ-XS. The method was evaluated in six different commodity types including salmon, tilapia, ground beef, beef liver, beef kidney, and chicken eggs.

This approach proved to be accurate, sensitive, and robust for a range of 30 PFAS compounds of varying chemistry classes to match the challenging concentrations published in reports by the European Food Safety Authority (EFSA) and the US Food and Drug Administration (FDA).

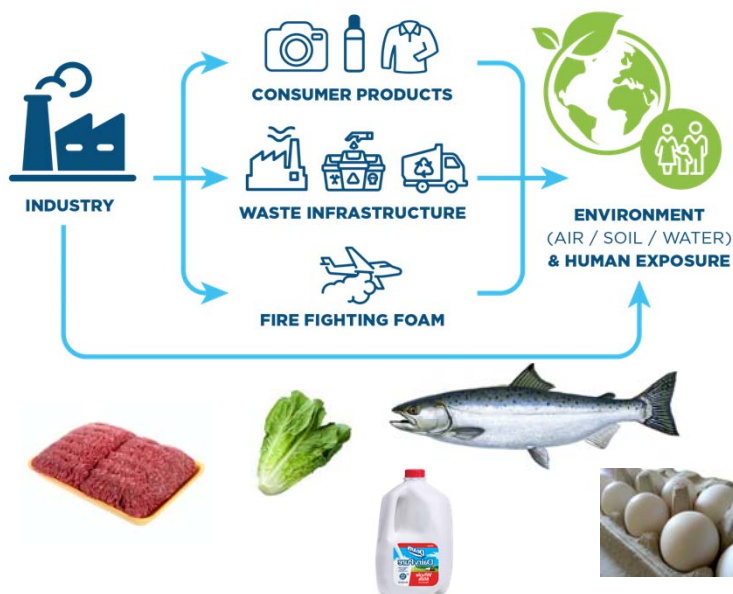

## Sensitive PFAS analysis from Edible Produce on Xevo TQ-XS after QuEChERS extraction

**Andrea Perissi**  
*MS Sales Specialist Waters Italy*

### Agenda

- Why are we looking for PFAS in different food matrixes?
- In which direction are the regulatory bodies moving?
- Which Instrument configuration Waters suggest to reach the analytical target?
- Do we need different approach for different commodities?

## Per- and Polyfluoroalkyl Substances (PFAS)

- PFAS can enter in the environment throughout many routes
- Contaminated water, soil and biosolids are often used in food production
- PFAS uptake and bioaccumulation in food supply is a risk

## Regulatory Scenario

- To date, most of the analytical efforts have been focused on PFAS throughout the environmental matrixes,. However the estimation of PFAS exposure for food sources is rapidly increasing in food safety evaluation
- Regulatory measures are in progress within Europe to protect/ limit consumer exposure to PFAS
- Certain food commodities are more susceptible of PFAS contamination (milk, eggs, fish)
- Maximum Levels (MLs) for certain PFAS in food are being established using ALARA (As Low As Reasonably Achievable) approach

## Determination of 16 Perfluoroalkyl and Polyfluoroalkyl Substances (PFAS) in Food using Liquid Chromatography-Tandem Mass Spectrometry (LC-MS/MS)

Version 2019 (2019)

Author: Susan Genualdi and Lowri deJager

CFSAN/ORS reviewers: Tim Begley, Gregory Noonan

- Single laboratory validated in lettuce, milk, bread, fish
- QuEChERS based method with dSPE and/or SPE clean up
- 16 PFAS included:
  - C4 – C10 carboxylates
  - C4 – C8 sulfonates
  - GenX, ADONA, 9CI-PF3ONS (F53B major), 11CIPF3OUdS (F53B minor)

Table 3. Sample preparation conditions based on food commodity type

| Commodity         | Amount of sample used: | mL of water added: | mL of CH <sub>3</sub> CN added: | Concentrate with nitrogen?          |
|-------------------|------------------------|--------------------|---------------------------------|-------------------------------------|
| Fruits/vegetables | 5.0 g                  | 5                  | 10                              | no                                  |

## Instrument Methods

### Source Parameters

- Instrument: Xevo TQ-XS
- Ion Mode: ESI-
- Capillary Voltage: 0.5 kV
- Desolvation Temperature: 350°C
- Desolvation Flow: 900 L/hr
- Cone Flow: 150 L/hr

### LC Method

- Instrument: Acquity I Class PLUS with **PFAS Kit**
- Column: ACQUITY BEH C18 2.1mm x 100 mm, 1.7 µm
- Mobile Phase A: Water + 2 mM ammonium acetate
- Mobile Phase B: Methanol + 2 mM ammonium acetate
- Injection Volume: 10 µL
- Gradient:

| Time (min) | Flow (mL/min) | %A | %B |
|------------|---------------|----|----|
| 0          | 0.3           | 95 | 5  |
| 1          | 0.3           | 75 | 25 |
| 6          | 0.3           | 50 | 50 |
| 13         | 0.3           | 15 | 85 |
| 14         | 0.3           | 5  | 95 |

## Method Development Strategy

QuEChERS, dSPE or OASIS WAX

- Starting from consolidated instrumental method from PFAS analysis in environmental samples, we worked on sample prep for the different food commodities
- For vegetables we started from FDA method using QuEChERS extraction
- For fatty matrixes suggested by EURL as more critical for PFAS contamination we started with SPE approach already developed using OASIS WAX

## Sample Preparation of Different Food Samples

Waters  
THE SCIENCE OF WHAT'S POSSIBLE™

### Determination of PFAS in food

#AnalyticalFoodies

## Increasing sample complexity

- Total Workflow for the Sensitive Analysis of Per- and Polyfluoroalkyl Substances (PFAS) in Fish, Meat, Edible Offal and Eggs
- Alkaline digestion followed by WAX SPE was implemented for extraction of complex food commodities such as fish, meat, edible offal, and eggs followed by analysis using Xevo TQ-XS. This approach proved to be accurate, sensitive, and robust for a range of 30 PFAS compounds of varying chemistry classes.
- One extraction method for multiple types of challenging matrices.
- Sensitive analysis on TQ-XS to reach detected levels in real samples compiled and published by EFSA and FDA.
- Use of the PFAS Analysis Kit to minimize system contamination.

## Sample Preparation Food of Animal Origin

*SPE sample enrichment with Xevo TQ-S micro*

### Application Note

Total Workflow for the Sensitive Analysis of Per- and Polyfluoroalkyl Substances (PFAS) in Fish, Meat, Edible Offal, and Eggs

Kari L. Organtini, Stuart Adams, Simon Hind, Renata Jandova

Waters Corporation

### Prepare samples (2 g)

Alkaline digestion in MeOH and dilution in water  
pH adjust to < 6 → activates ion exchange sites in WAX sorbent when loaded

Condition Cartridge

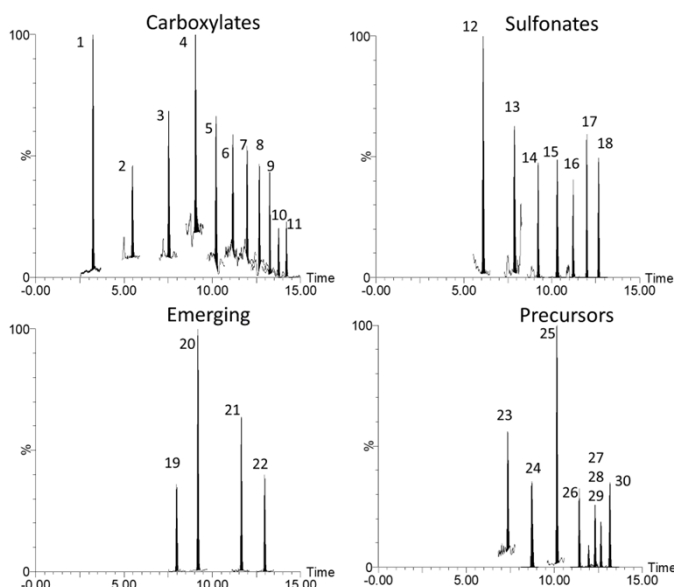

Load Sample

Rinse Cartridge

### Elute analytes

Eluent with pH > 8 → "turns off" ion exchange sites in WAX sorbent to release PFAS  
Dry and dilute

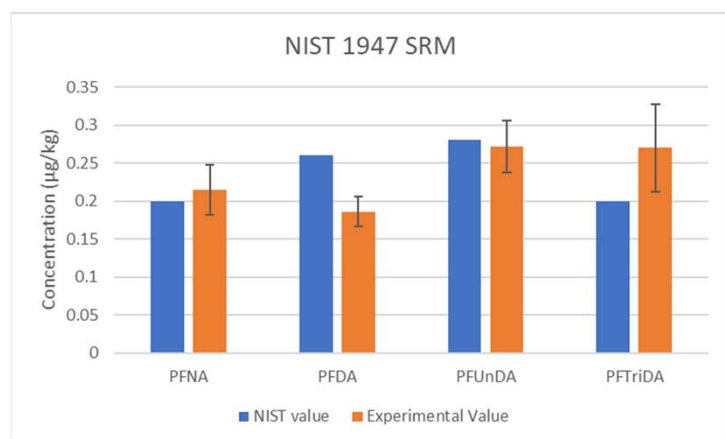

## Chromatogram of Salmon Extract Spiked at 0.1 ng/g

- Chromatogram shows the 30 PFAS evaluated in the method spiked into salmon extract at 0.1 ng/g (equivalent to 0.02 ng/mL injected on instrument)
- Peak assignments are located in the Appendix of the application note

Even though the extraction method results in 5x dilution of sample concentration, the sensitivity of the TQ-XS allows for trace level detection of PFAS in matrix samples

## Confidence in Results Shown with NIST SRM 1947

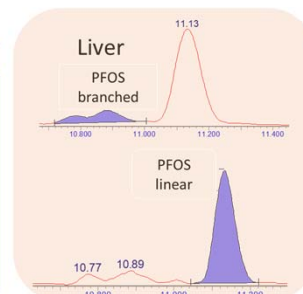

NIST SRM 1947 reports low level concentrations of 4 PFAS in fish tissue. The method presented in the application note produces very similar results which provides confidence of method accuracy.

- NIST SRM 1947 is a standard reference material consisting of fish tissue where four PFAS have been identified
- The figure shows the comparison of the values determined using the application note method (orange) compared to the values reported by NIST (blue)
- Values are close to the results reported by NIST showing this method is accurate.

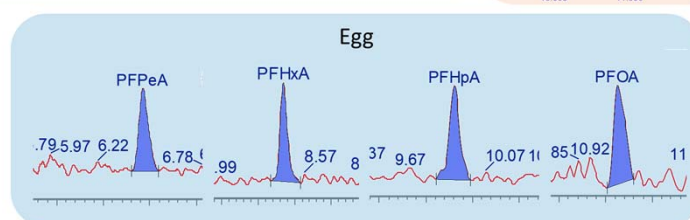

## PFAS Detected in Food Samples

- Beef Liver and Chicken Eggs purchased from local grocery stores contained detectable levels of PFAS (shown in table and chromatograms)

| PFAS          | Liver (ng/g) | Egg (ng/g) |
|---------------|--------------|------------|
| PFOS linear   | 0.52         | -          |
| PFOS branched | 0.24         | -          |
| PFOS (total)  | 0.76         | -          |
| PFPeA         | -            | 0.18       |
| PFHxA         | -            | 0.25       |
| PFHpA         | -            | 0.29       |
| PFOA          | -            | 0.13       |

The method was applied to real unknown samples with detection of PFAS in two types of food samples.

## Conclusions

- An alkaline digestion extraction followed by WAX SPE clean-up is provided to extract PFAS from challenging food samples of meat, fish, edible offal, and eggs.
- Sensitive and accurate analysis of extracts was performed using the Xevo TQ-XS allowing for detection and quantitation limits in the sub-ng/g range.
- Considering the last EURL recommendation SPE Approach should be evaluate also for vegetables in order to decrease limit of quantification.
- Utilization of the isotope dilution method allows for accurate calculation of PFAS concentration in samples without having to use matrix matched calibration curves.
- Five PFAS were detected in two different food samples purchased from local grocery stores.

Stockholm Convention on Persistent Organic Pollutants (POPs)

### The 9 new POPs

An introduction to the nine chemicals added to the Stockholm Convention by the Conference of the Parties at its fourth meeting

**The Stockholm Convention on POPs (Persistent Organic Pollutants) has been updated with the introduction of PFOA and PFOS among the substances defined as Persistent Organic Pollutants**

| Chemical  | Pesticides | Industrial chemicals | By-products |
|---|------------|----------------------|-------------|
| Alpha Hexachlorocyclohexane   | +          |                      | +           |
| Beta Hexachlorocyclohexane  | +          |                      | +           |
| Chlordecone   | +          |                      |             |
| Commercial pentabromodiphenyl ether   |            | +                    |             |
| Commercial octabromodiphenyl ether  |            | +                    |             |
| Hexabromobiphenyl   |            | +                    |             |
| Lindane   | +          |                      |             |
| Pentachlorobenzene  | +          | +                    | +           |
| Perfluorooctane sulfonic acid, its salts and perfluorooctane sulfonyl fluoride (PFOS) |            | +                    |             |

**IARC has classified PFOA in group 2B, or as a possible human carcinogen.**

Due to growing concerns about the potential impact on health and the environment, the production and use of long-chain PFAS has decreased in favor of short-chain ones. In place of PFOA and PFOS, new molecules such as GenX, (HFPO-DA), ADONA, cC6O4 have been introduced to the market. They are PFAS whose chemical structure has been modified by inserting oxygen between the perfluorinated chains.

Traditional and "Emerging" PFAS: a Common Concern for Environment and Food Science, Connected by Food Packaging Issues

Bologna, 15-09-2022

## WHAT ABOUT PFAS IN THE AIR?

The average concentrations of PFOA in air samples collected in urban areas are in the range  $0,00154 \div 0,152 \text{ ng/m}^3$

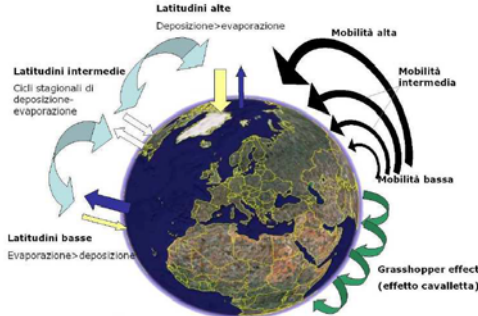

Higher average concentrations,  $0,101 \div 0,552 \text{ ng/m}^3$ , with maximum values equal to  $0,919$  and  $0,828 \text{ ng/m}^3$  were measured respectively in Oyamazaki, Japan, and Hazelrigg, United Kingdom, attributing in the latter case the values to the emissions of a fluoropolymer production plant located 20 km downwind of semi-rural communities.

Much higher PFOA concentrations,  $70 \div 170 \text{ ng/m}^3$ , were measured in 6 of the 28 air samples collected at the perimeter of the DuPont Washington Works fluoropolymer manufacturing plant, near Parkersburg, West Virginia (US).

**There are no Italian or European reference values**

**There are no official approved methods for sampling and analysis**

**For some molecules there are no certified materials and analytical standards (ADV-N2)**

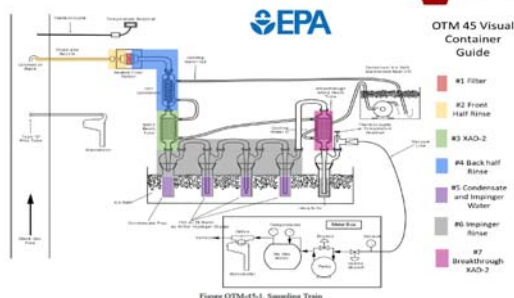

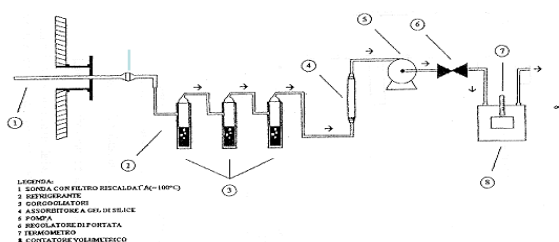

Traditional and "Emerging" PFAS: a Common Concern for Environment and Food Science, Connected by Food Packaging Issues

Bologna, 15-09-2022

## HOW SAMPLING NEW PFAS IN THE AIR???

ARPA Piemonte and ARPA Veneto are investigating different ways of monitoring aeriforms:

- atmospheric depositions
- high volume sampling
- sorbent tubes
- atmospheric emissions (Arpa Veneto)

## WET AND DRY DEPOSITION

Collected with HDPE deposimeters in accordance with UNI EN 15841 (Normalized method for the determination of arsenic, cadmium, lead and nickel in atmospheric depositions)

Advantage:

- long period of observation of exposure
- availability of analytical methods for water analysis
- no sample extraction procedures

Disadvantage:

- low sensitivity
- accumulation data and not exposure data

*You can evaluate the mass of pollutant that in a period of time is transferred from the atmosphere to the soil, vegetation, water.*

## TOTAL DEPOSITION - (wet+dry)

Concentration =  $[\mu\text{g} \cdot \text{m}^{-2} \cdot \text{day}^{-1}]$ .

## WET AND DRY DEPOSITION

**BEFORE SAMPLING:** Rinsing the deposimeters with ultrapure Millipore water and keeping a control aliquot  
**SAMPLING PERIOD:** campaigns of approximately 30 days

**SAMPLE RECOVERY:** a volume of approximately 500ml of ultrapure Millipore HPLC water was chosen for sample recovery from deposimeters.

**STORAGE:** in polypropylene containers at a temperature  $<4^{\circ}\text{C}$ .

**ANALYSIS:** with the analytical technique LC-MS / MS triple quadrupole (Reports ISTISAN 19/7 ISS.CBA.052.REV00).

## WET AND DRY DEPOSITION

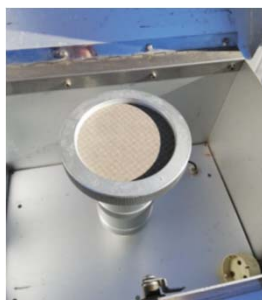

Tests carried out in duplicate in Piedmont exposed area during all the 12 months in 2021 have returned information about the presence of site-specific PFAS compounds (in particular  $\text{cC}_6\text{O}_4$  and ADV-N2), while they did not reveal the presence of other PFAS, if not traces of PFOA.

|     | ADV_N2                             | PFOA                               | cC6O4                              |
|-----|------------------------------------|------------------------------------|------------------------------------|
|     | $\mu\text{g}/(\text{m}^2\text{d})$ | $\mu\text{g}/(\text{m}^2\text{d})$ | $\mu\text{g}/(\text{m}^2\text{d})$ |
| MIN | 0,08                               | <LOQ                               | 0,16                               |
| MED | 0,58                               | 0,02                               | 2,20                               |
| MAX | 1,26                               | 0,04                               | 5,33                               |

Piedmont not exposed area did not reveal the presence of any PFAS (<LOQ).

In 2022 the monitoring stations were duplicated to assess the dispersion of pollutants in different directions.

## HIGH VOLUME SAMPLING

### SUPPORTS:

- Quartz-fiber filters
- PUF pre-cleaned cartridge

### BEFORE SAMPLING:

PUF adsorbent plugs are subjected to 1-hour sonication in methanol

**SAMPLING PERIOD AND CONDITION:** campaigns of approximately 24 hours at 250 l/min

### SAMPLE RECOVERY:

- Quartz-fiber filters: 30' sonication in methanol at ambient temperature
- PUF pre-cleaned cartridge: ASE extraction with methanol

**STORAGE:** in polypropylene containers at a temperature  $<4^{\circ}\text{C}$ .

**ANALYSIS:** dilution 50:50 with water and direct injection with the analytical technique LC-MS / MS triple quadrupole (Reports ISTISAN 19/7 ISS.CBA.052.REV00).

## HIGH VOLUME SAMPLING

In accordance with other method like EPA TO9A (specific for PCDD/PCDF).

### Advantage:

- high flow
- long period of observation

### Disadvantage:

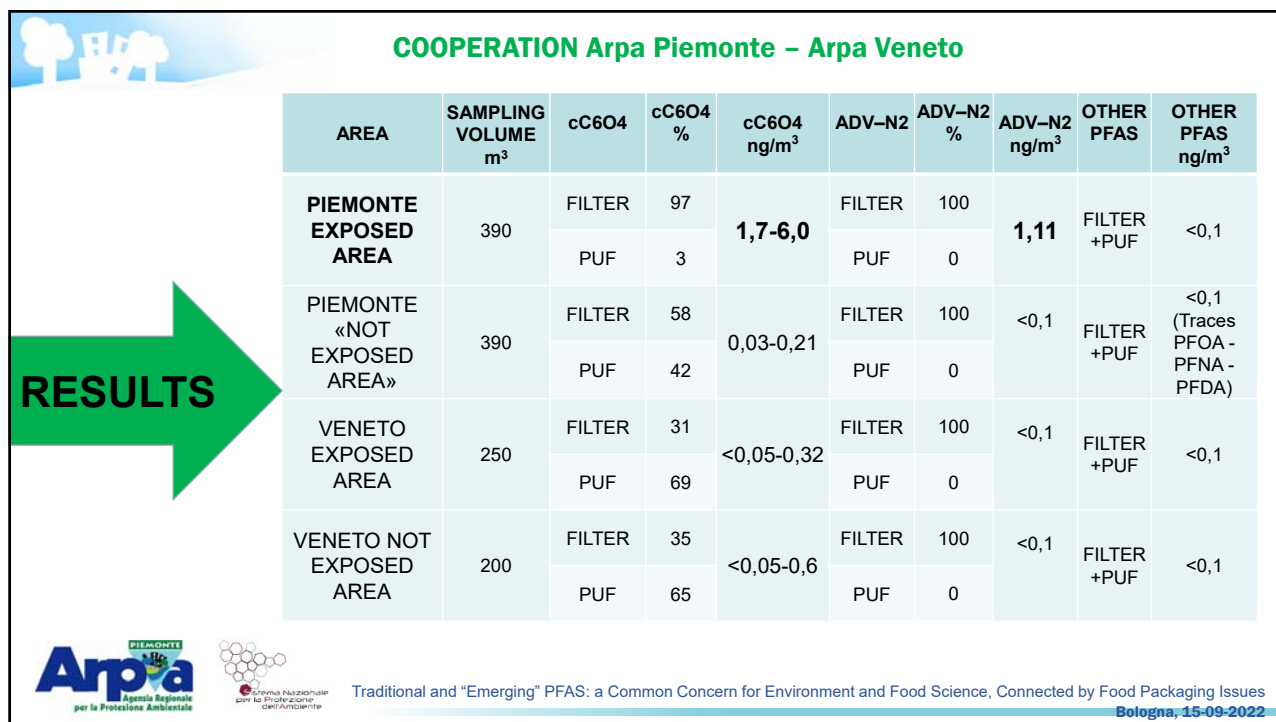

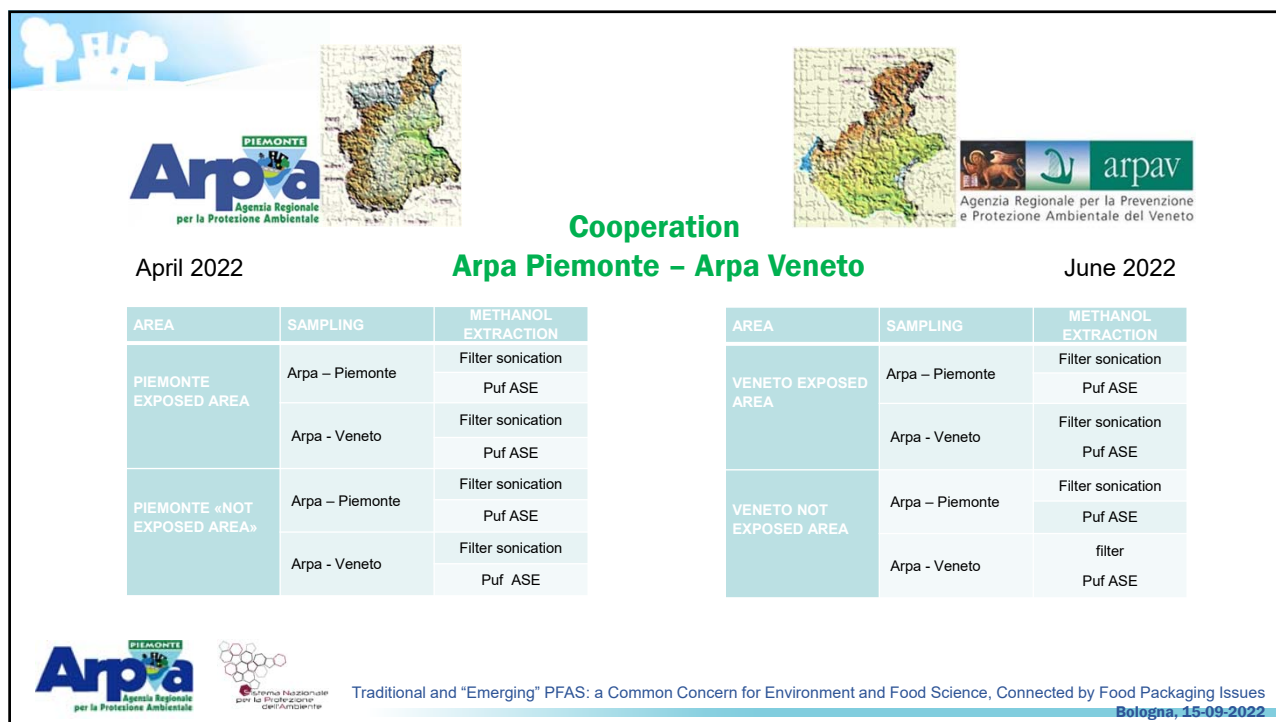

- power supply
- cartridge preparation

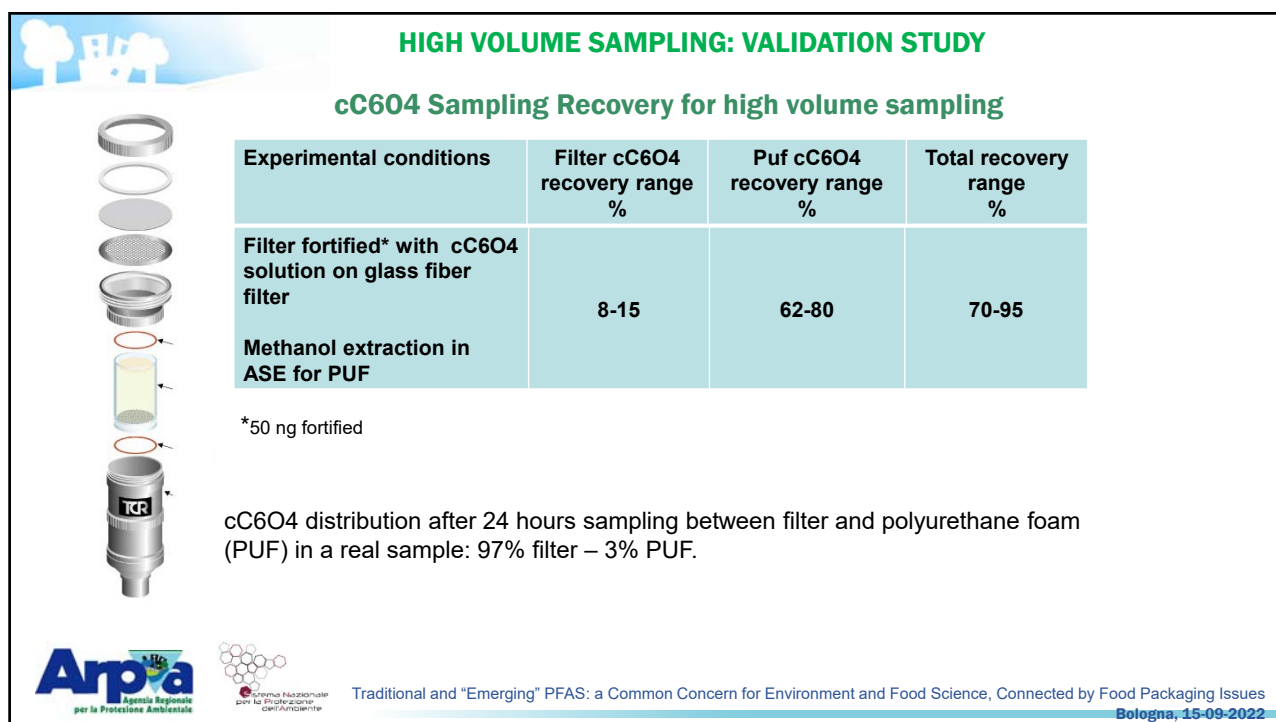

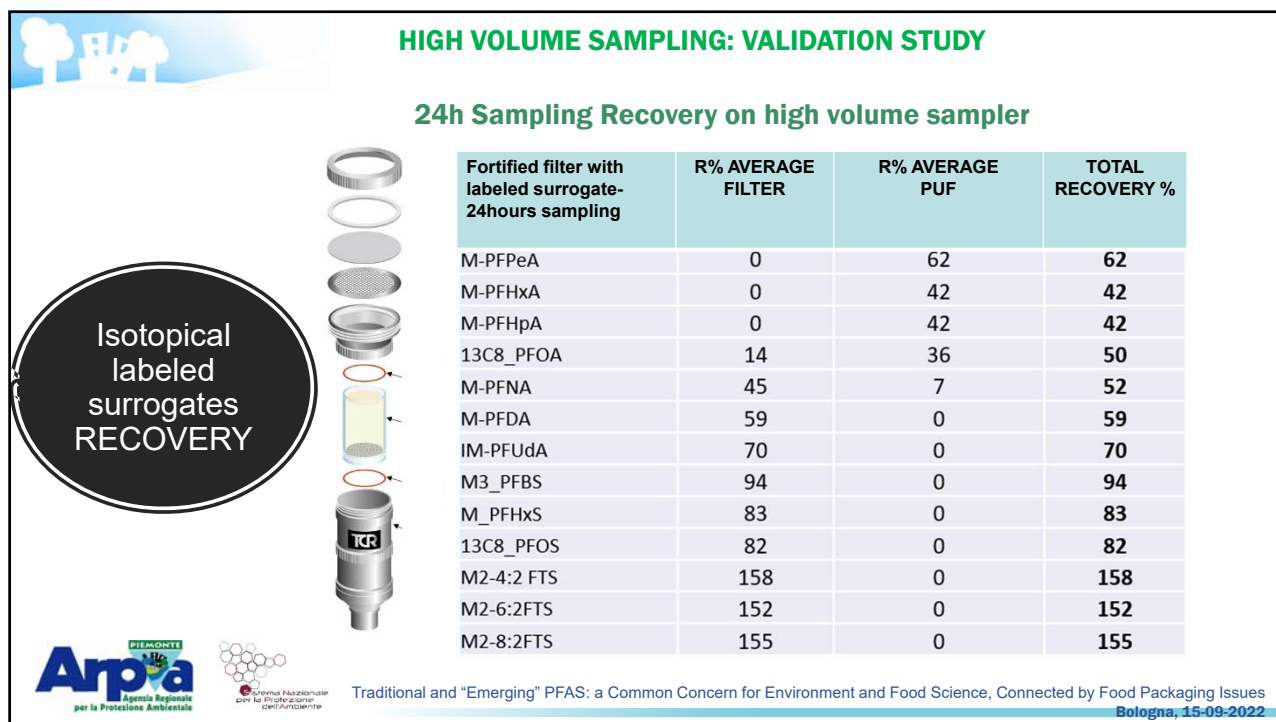

### CONCENTRATION IN AIR

Concentration =  $[\text{ng}\cdot\text{m}^{-3}]$ .

## AIR SAMPLING TUBES

### SUPPORTS:

Air sampling tubes: SKC 226-30-16 (XAD-2/ Glass Fiber Filter) with expiry date April 2025 and lot 13769.

**SAMPLING PERIOD AND CONDITION:** campaigns of approximately 6-24 hours at 1 l/min

### SAMPLE RECOVERY:

30' sonication in methanol at ambient temperature

**STORAGE:** in polypropylene containers at a temperature  $<4^{\circ}\text{C}$ .

**ANALYSIS:** dilution 50:50 with water and direct injection with the analytical technique LC-MS / MS triple quadrupole (Reports ISTISAN 19/7 ISS.CBA.052.REV00).

## AIR SAMPLING TUBES: VALIDATION STUDY

To simulate trapping of cC6O4 acid from air, known amounts of cC6O4 acid in 10  $\mu\text{l}$  methanol were added to the GFF/XAD-2 air sampling tubes. After drying for approximately 5 minutes, suction of air during 360 minutes at 1,0 l/min took place.

Each section of the tube was extracted with 5 ml methanol and was sonicated for 20 minutes

### cC6O4 Recovery for Air sampling tubes

| Front section cC6O4 recovery range % | Back section cC6O4 recovery range % | Total recovery range % | CV % |
|--------------------------------------|-------------------------------------|------------------------|------|
| 120-140 %                            | 0                                   | 120-140%               | 6 %  |

\*1 ng fortified (10  $\mu\text{l}$  100  $\mu\text{g/l}$ )

## AIR SAMPLING TUBES

In accordance with other occupational safety method.

Advantage:

- No power supply
- cartridge preparation

Disadvantage:

- low flow
- short period of observation

## CONCENTRATION IN AIR

Concentration =  $[ng \cdot m^{-3}]$ .

## Analysis of Perfluoroalkyl Substances in Hair by Agilent Bond Elut ENV Solid Phase Extraction and LC/Q-TOF

A rapid biomonitoring screening method using the Agilent 1290 Infinity II LC and the Agilent 6546 Q-TOF

### Abstract

This application note describes a rapid analytical method for the detection of 20 perfluoroalkyl substances (PFAS) in human hair within 10 minutes. Solid phase extraction (SPE) using the Agilent Bond Elut ENV cartridge was used to extract the sample. The extract was then separated using liquid-chromatography (Agilent 1290 Infinity II LC) coupled to a quadrupole time-of-flight mass spectrometer (Agilent 6546 Q-TOF) for accurate mass measurement of PFAS in hair. The limits of quantitation (LOQ) were in the range of 0.07 to 0.5 ng/g, demonstrating the sensitivity of the method. Linearity was 0.1 (or 0.2 or 0.5) to 10 ng/g, and relative standard deviations (RSDs) were 1 to 16%. To verify the applicability of the method for the determination of PFAS in hair, 11 samples obtained from adults in the general population were tested.

## Compounds Tested

11-chloroeicosafuoro-3-oxaundecane-1-sulfonic acid  
(11Cl-PF30UdS)

9-chlorohexadecafluoro-3-oxanonane-1-sulfonic acid  
(9Cl-PF30NS)

perfluoro-*n*-butanoic acid (PFBA)

perfluoro-1-butanefluoronic acid (PFBS)

perfluoro-*n*-decanoic acid (PFDA)

perfluoro-*n*-dodecanoic acid (PFDoA)

perfluoro(2-ethoxyethane)sulfonic acid (PFEESA)

perfluoro-1-heptanesulfonic acid (PFHpS)

perfluoro-*n*-heptanoic acid (PFHpA)

perfluoro-1-hexanesulfonic acid (PFHxS)

perfluoro-*n*-hexanoic acid (PFHxA)

perfluoro-3-methoxypropanoic acid (PFMPA)

perfluoro-4-methoxybutanoic acid (PFMBA)

perfluoro-*n*-nonanoic acid (PFNA)

perfluoro-1-octanesulfonic acid (PFOS)

perfluoro-*n*-octanoic acid (PFOA)

perfluoro-*n*-pentanoic acid (PFPeA)

perfluoro-1-pentanesulfonic acid (PFPeS)

perfluoroundecanoic acid (PFUnA)

dodecafluoro-3H-4,8-dioxanonanoic acid (ADONA)

## QTOF 6546

Resolution independent of acquisition rate

Isotopic Fidelity performance

A study on the Agilent Q-TOF showed a consistently low isotope ratio accuracy (RIA) error.

The RIAs for 623/622 at 10 different acquisition rates were all within 5% of the expected value (RSD = 2.8%)

8

## Sample Prep

## Sample Prep

The high sensitivity required to detect contaminants in hair, in the order of ng/g, we developed a method with solid-phase extractions SPE

### 200 mg, 6 mL Agilent Bond Elut ENV SPE cartridges

- ✓ Rinse the Hair sample with 10 mL of water and then double with 10 mL of acetone
- ✓ Cut and weight 100 mg hair sample
- ✓ Add labeled IS
- ✓ Add 2 ml Acetonitrile
- ✓ Ultrasonic bath for 45 minutes at 45 °C ( two times)
- ✓ SPE clen-up
- ✓ Reconstituted sample in 500  $\mu$ L water/methanol (90/10 v/v)
- ✓ Injection

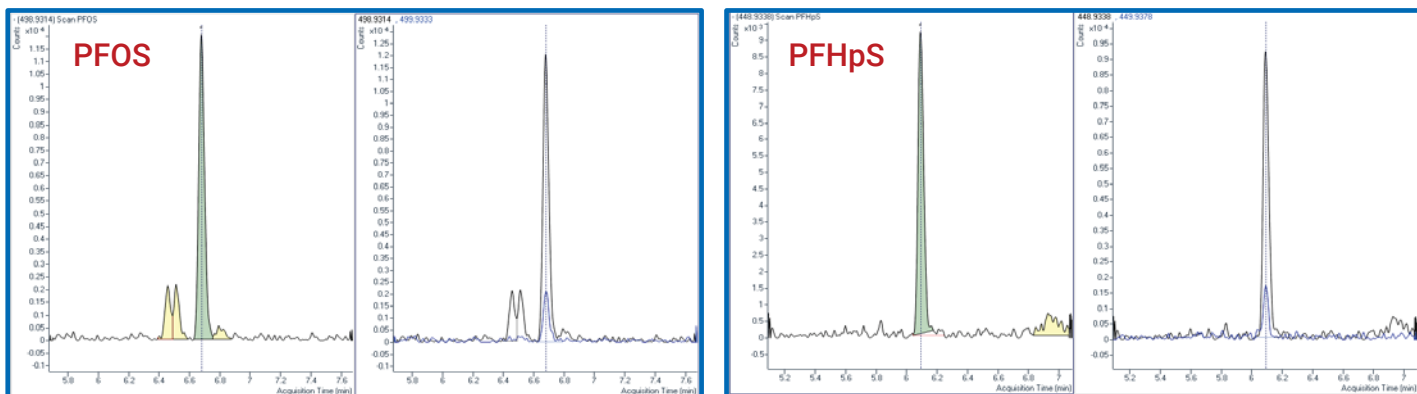

# Results

## Conclusion

The study has shown the suitability of LC/Q-TOF for the determination of PFAS in human hair.

Fast and reliable method used Agilent Bond Elut ENV cartridges for SPE to prepare the sample extracts for analysis using an Agilent 6546 LC/Q-TOF.

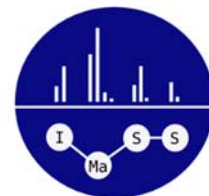

Speed, sensitivity, linearity, and accuracy of the accurate-mass measurement of PFAS using LC/Q-TOF makes it suitable for routine biomonitoring studies.

The method could also be used for retrospective screening of samples for new members of the PFAS family, for example the emerging class of branched PFAS.

## Fluorinated organic compound: Background history

Industrial application of fluorinated organic compounds started (Chlorofluorocarbons (CFC) as refrigerants).

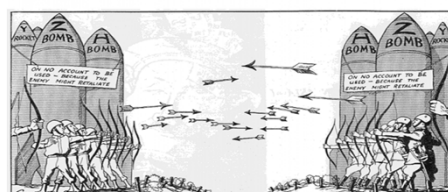

The major turning point in the history of industrial fluoroorganic chemistry was the beginning of the Manhattan Project for development of nuclear weapons in 1941.

The Manhattan Project triggered the need for highly resistant materials, lubricants, coolants and the development of technology for handling extremely corrosive fluoroinorganic compounds

After 1945, with the beginning of the Cold War, various defense programs provided a constant driving force for further development of the chemistry and use of organofluorine compounds.  
In the 1950s and 60s more civilian applications of fluorinated pharmaceuticals and materials moved into the forefront

## The Cold War 1945-1991

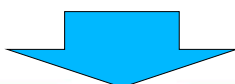

## Fluorinated organic compound: Background history

### Commercial Uses

Fluorinated surfactants can lower aqueous surface tension to less than 16 dynes/cm and function at very low concentrations (e.g., 100–500 mg/L or parts-per-million, ppm). They are effective in basic/acidic aqueous media and in organic solvents

- *superior wetting, spreading, and leveling properties for all types of surfaces.* They give uniform film formation of coatings and eliminates pinholes and craters, even when applied to unclean surfaces

- *extremely stable both chemically and thermally.* Some of them are stable even in hot chromic acid, concentrated sulfuric acid or hydrofluoric acid

- *Aqueous Film-Forming Foams*
- *Enhanced Oil Recovery*
- *Coatings*
- *Electroplating and Electrowinning*
- *Electronics*

- *Paper*
- *Mining*
- *Photographic Films*
- *Fluoropolymer Polymerization Aid*
- *Pesticide Application*

## Perfluorinated organic compound: Environmental Regulatory Framework: Elements

### IN EUROPEAN UNION

is classified as

- as POP's (Reg. 757/2010) after PFOS was added to the Annex B of the Stockholm Convention in 2009
- Priority Substance for Water (Dir 2013/39/UE)
- Substance with Restriction limit as reported in Reg(EU) No 757/2010 amending Reg (CE) 850/2004

is classified as

- Candidate in the SVHC List (Substances of Very High Concern) after MSC (Member States Committee) identified in June 2013 PFOA as PBT.
- Substance with Restriction limits as reported in Reg. (UE) 2017/1000 (entry 68)

## Recent developments in Solid Matrix PFAS Methods

*QuEChERS is considered accurate and highly productive at ultra trace levels. Yet, for the analysis of PFAS in food, this method is not widely applied compared to the straightforward SLE and IPE methods. Recently, a one step QuEChERS extraction and purification was found to be successful.*

## Concentrations of PFCAs and PFOS in muscle depending on weight of specimen

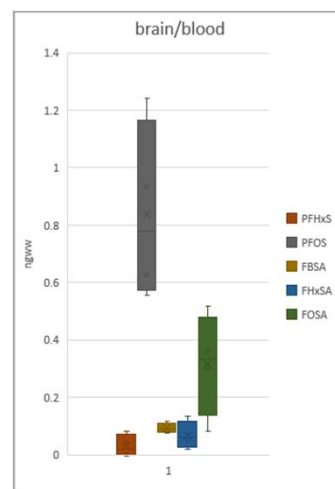

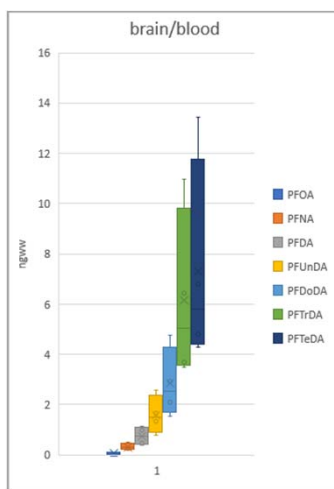

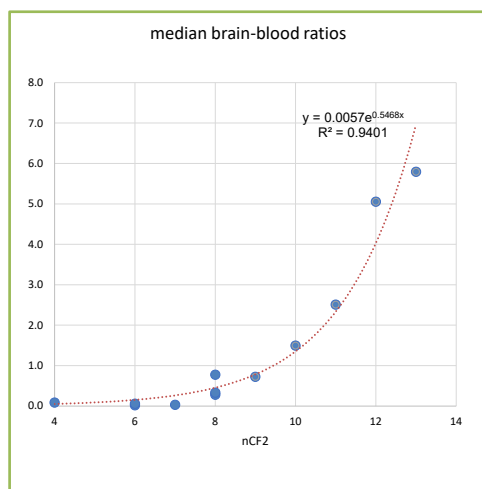

## Concentrations of FASA in muscle depending on weight of specimen

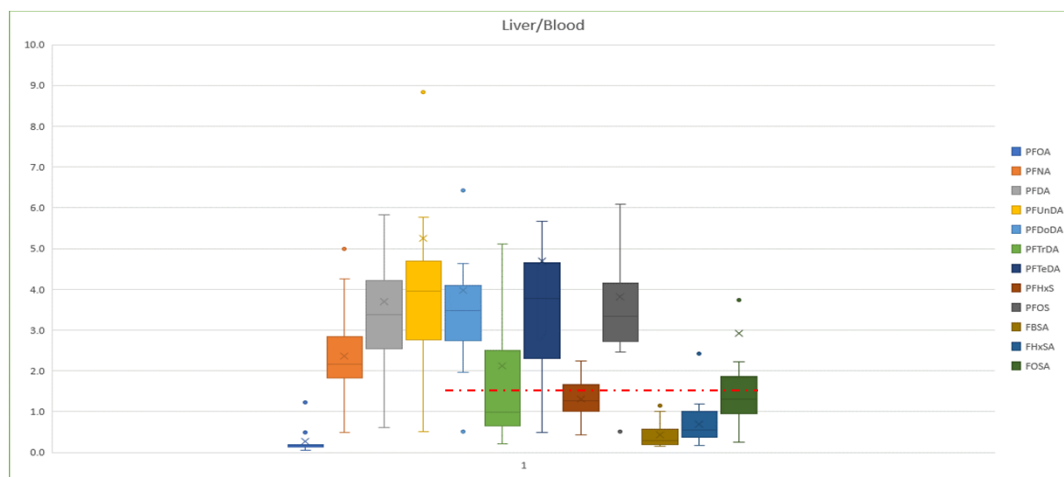

## Muscle-Blood Ratios

## Brain-Blood Ratios

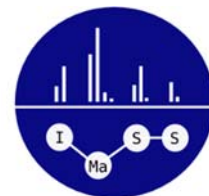

## Liver-Blood Ratios

## Conclusions

- Striped dolphin is exposed to different type of contaminant (PFAS) and their accumulation was confirmed in some tissues (brain, muscle, liver, blood) with elevate concentrations
- The fluoroalkyl substances are potentially very dangerous for aquatic organisms, especially for apex predators: affect cellular functions, cause developmental and neuroendocrine anomalies.
- The intake of PFAS substances is probably due to diet and structure of food chain
- High concentrations of contaminants may have played an important role in causing, or at least in being a co-cause, of the death of dolphins
- Further in depth research is needed
- We'll propose to SNPA to adopt the shown analyses as a routine process also for dolphins and their preys (detection in biota as requested by Dgls 172/15)

## Abstract

Per- and polyfluoroalkyl substances (PFAS) are persistent, bioaccumulative pollutants found in water resources at concentrations harmful to human health. Whereas current PFAS destruction strategies use nonselective destruction mechanisms, we found that perfluoroalkyl carboxylic acids (PFCAs) could be mineralized through a sodium hydroxide-mediated defluorination pathway. PFCA decarboxylation in polar aprotic solvents produced reactive perfluoroalkyl ion intermediates that degraded to fluoride ions (78 to ~100%) within 24 hours. The carbon-containing intermediates and products were inconsistent with oft-proposed one-carbon-chain shortening mechanisms, and we instead computationally identified pathways consistent with many experiments. Degradation was also observed for branched perfluoroalkyl ether carboxylic acids and might be extended to degrade other PFAS classes as methods to activate their polar headgroups are identified.

## A New OECD Definition for Per- and Polyfluoroalkyl Substances

Zhanyun Wang,\* Andreas M. Buser, Ian T. Cousins, Silvia Demattio, Wiebke Drost, Olof Johansson, Koichi Ohno, Grace Patlewicz, Ann M. Richard, Glen W. Walker, Graham S. White, and Eeva Leinala

PFAS definition: “PFAS are defined as fluorinated substances that contain **at least one fully fluorinated methyl or methylene carbon atom (without any H/Cl/Br/I atom attached to it)**, i.e., with a few noted exceptions, any chemical with at least a perfluorinated methyl group ( $-\text{CF}_3$ ) or a perfluorinated methylene group ( $-\text{CF}_2-$ ) is a PFAS”. The “noted exceptions” refer to a carbon atom with a H/Cl/Br/I atom attached to it.

Ultra-short chain PFAS

Surfactants / bioaccumulable

## Next Generation PFAS: Shortening the fluorinated carbon chain

- Shorter-chain homologues

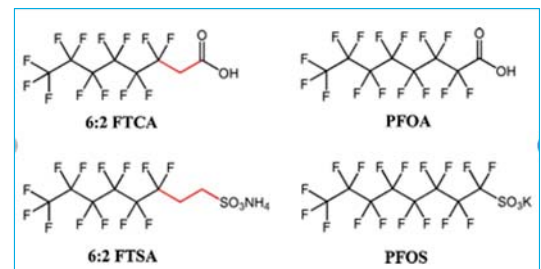

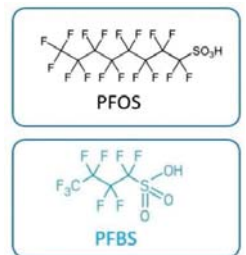

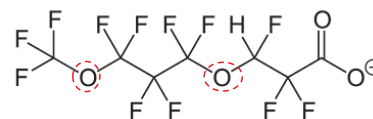

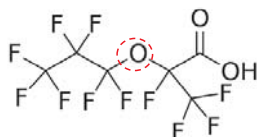

- POSF-based derivatives  $\longrightarrow$  PHxSF-based derivatives, PBSF-based derivatives
- PFOA  $\longrightarrow$  PFHxA

- Replace some fluorinated carbon atoms with non-fluorinated carbon atoms

- PFOA  $\longrightarrow$  6:2 FTCA

- Add oxygen atoms between fluorinated carbons (ethers: similar)

- ADONA, GenX

## Metodi chimici aspecifici

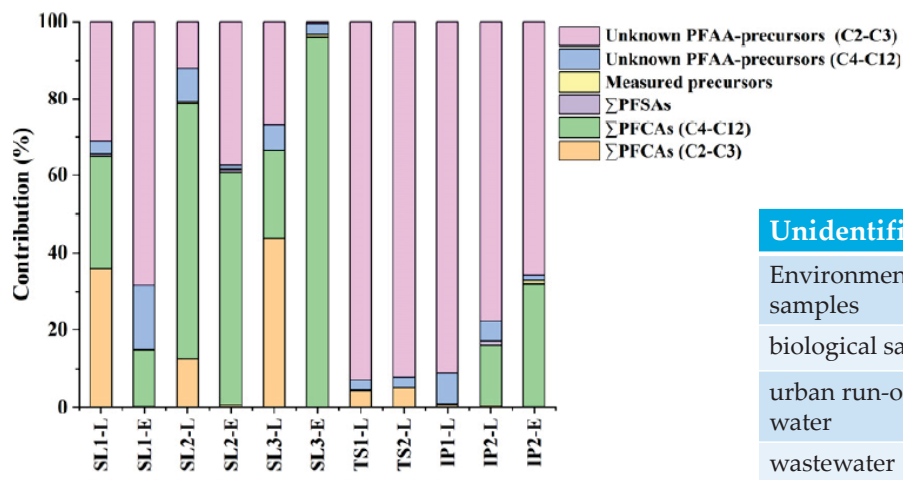

- TOF Assay (Total OrganoFluorine)
  - EOF (Extractable OrganoFluorine)
  - SPE/solvent extraction + CIC (Combustion Ion Chromatography) (~0.1  $\mu\text{g F/L}$ )
- TOP Assay (Total Oxidizable Precursor) for oxidizable PFAS (precursors)
  - It does not "represent" the transformation in environment

- **Fast, cheap**
- **No identification of the substance (no selectivity)**
- **Low sensitivity (heavily contaminated samples)**
- **Poor extraction efficiency for very polar PFAS**
- **It also measures fluorinated compounds no PFAS**

*L'importanza dei PTP dinamici per la valutazione  
delle prestazioni dei test valutativi di laboratorio  
utilizzando matrici naturali - PFAS*

## **The importance of dynamic PTPs for performance evaluation of laboratory proficiency testing using natural matrices - PFAS**

**Claudio Carrer, Loretta Gallochio**  
**InterCinD-Lab Service Analytica**

IMaSS Emerging Contaminants Days 15 September 2022

InterCinD started in 2009 by collaboration between INTERCAL and CIND.

This collaboration, for instance, was intended to offer to participant laboratories a larger flexibility in the number of samples and in the sample type by using similar study design and statistics. The improvements and benefits of this collaboration are now fully integrated in the InterCinD.

Essence of InterCinD are the materials used, all REAL MATRIX available in NATURE, prepared and characterized according to the international guidelines for the production of reference materials.

IMaSS Emerging Contaminants Days 15 September 2022

## WHY PARTICIPATE IN PTS ?

UNI CEI EN ISO/IEC 17025:2018

- Assess and monitor performance
- Identify problems and implement actions for risk mitigation and improvement
- Define the effectiveness and comparability of test methods
- Ensure greater reliability for laboratory customers
- Validate uncertainty statements

## What criteria should be used when choosing the right PTP and PT?

4 Things to consider when choosing a PT provider:

1. Accreditation ISO17043
2. Type of sample
3. Parameter selection
4. Communication

## Accreditation UNI CEI EN ISO/IEC 17043

The PTP that has achieved accreditation according to UNI CEI EN ISO/IEC 17043:2010 **demonstrates competence** in designing, preparing, managing and organising the tests specified in the scope of accreditation.

An accredited PTP demonstrates, with the Accredia mark, the achievement of conformity to the standard, specific competence and fuels consumer confidence in the service provided.

**InterCIND accredited ACCREDIA Nr. PTP0007 P since February 2015 is a globally recognised PTP for POP schemes.**

## Type of sample

The accredited Proficiency Testing scheme in which a laboratory participates must be as similar as possible to the activities and operations that the laboratory itself routinely performs, in terms of measurement standards, test materials and type of measurement.

PT suppliers should provide naturally contaminated materials (NCMs). In these 'real samples', the analyte is naturally incorporated into the matrix and allows a **more realistic evaluation than in artificially fortified samples.**

**INTERCIND offers evaluation tests for various environmental parameters and matrices, using only naturally contaminated materials and homogenous samples.**

## Parameter selection

The matrices, analytes and **concentrations** used should fit in with routine laboratory practices.  
On natural matrices, it is not always possible to guarantee uniformity across all parameters under investigation.

## Comunication

The necessary information must then all be readily available and understandable.  
The results must be provided in a timely manner.

## INTERCIND PROGRAM 2023

<https://www.intercind.eu>

## How to create a proficiency test

- Matrix identification
- Characterisation
- The technical director decides whether the matrix is interesting or not.
- If positively evaluated, the matrix is appropriately processed, checked and sent to the homogeneity verification phase.

## Homogeneity

The homogeneity of the matrices is assessed before distribution to the participants to ensure that it does not affect the performance evaluation.

The homogeneity valuation is done in conformity to [UNI ISO 13528:2022](#) annex B.

The results of the homogeneity tests are available in the final report by provider.

The matrix is considered to be adequately homogeneous if:

$$S_s \leq 0.3 \sigma_{PT}$$

where:

$S_s$ : is standard deviation between samples

$\sigma_{PT}$  is PT deviation standard

## Stability

The same matrices are tested for stability in conformity [UNI ISO 13528:2022](#) annex B

Usually, the PTP tests the matrix immediately before and after the PT or, in special cases, during the proficiency test to determine any deviation.

Stability is verified for each analyte to be determined in the PT.

$$|y_i - y| \leq 0,3 \times \sigma_{PT}$$

where:

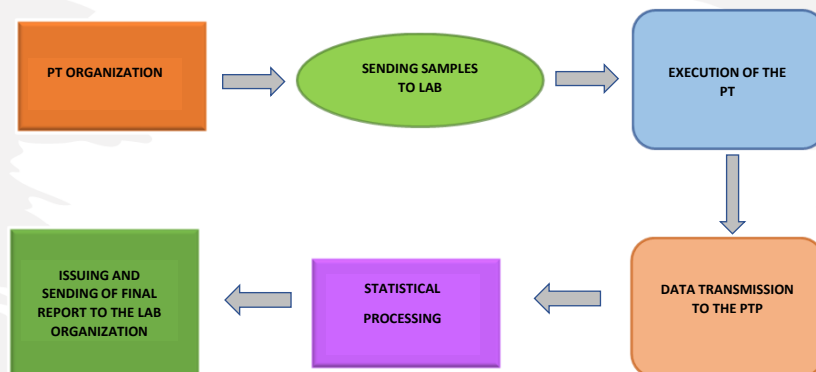

$y_i$  is the average value of the results of the last phase of the stability test

$y$  is the average value of the results of the first phase of the stability or homogeneity test

$\sigma_{PT}$  is the standard deviation of the PT

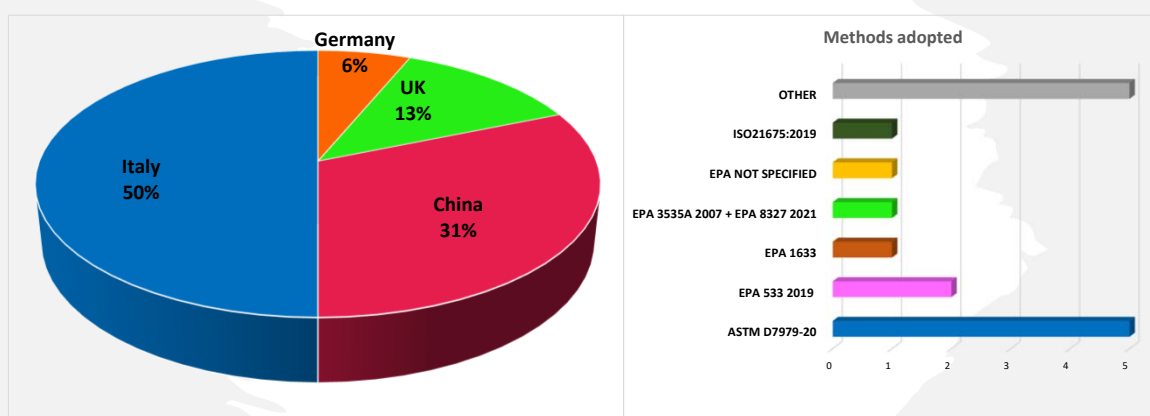

## PT SCHEME

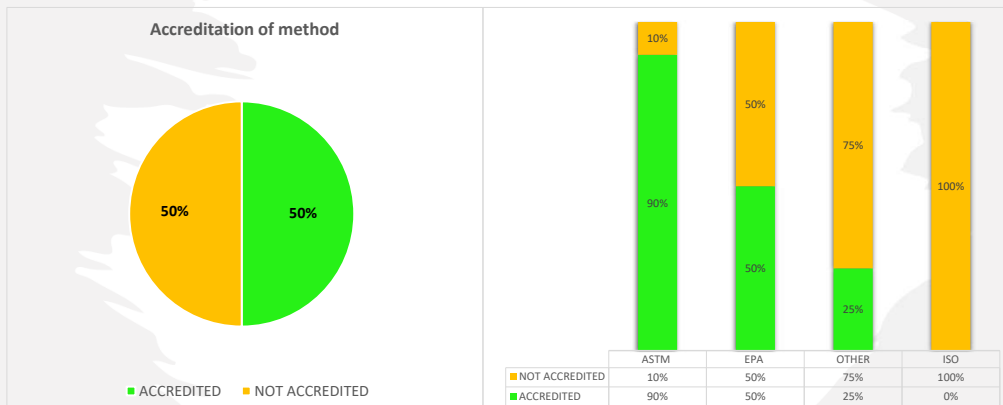

IMaSS Emerging Contaminants Days 15 September 2022

## CONSENSUS VALUE OR ASSIGNED VALUE AND UNCERTAINTY

UNI ISO 13528:2022, requires that the consensus value the assigned value is calculated as a robust mean, median or arithmetic mean

The uncertainty of the assigned values  $u(x_{PT})$  is calculated according to ISO 13528: 2022 as:

$$u(x_{PT}) = 1,25 \times s^*/\sqrt{p}$$

where :

$s^*$ : robust standard deviation

$p$ : the number of results

The UNI ISO 13528: 2022 standard put a limit on the value of  $u(x_{PT})$ . The following relationship must be verified:

$$u(x_{PT}) < 0.3 \sigma_{PT}$$

Target standard deviation of a PT determines the performance limits in a proficiency test

## Z score

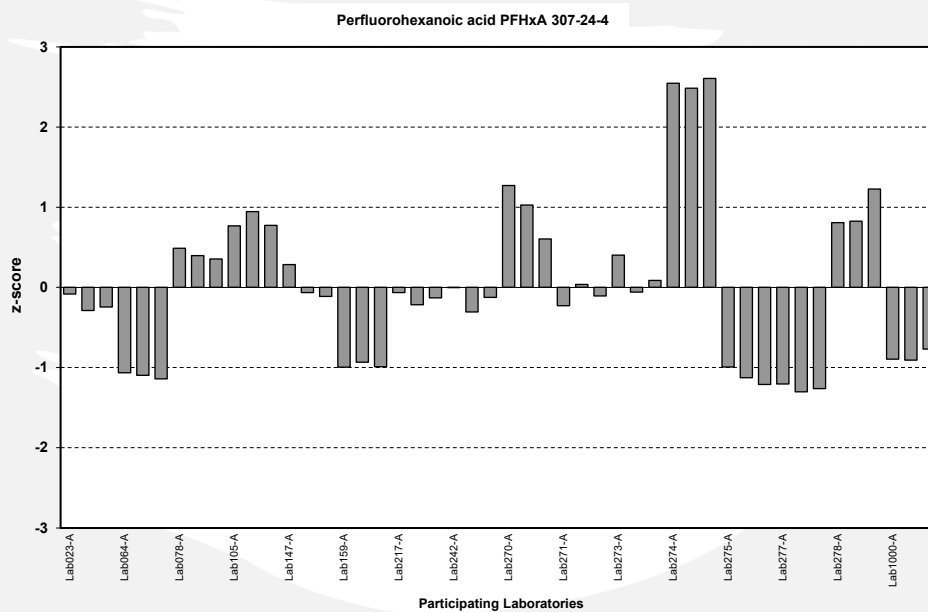

$$z_i = (x_i - x_{PT})/\sigma_{PT}(FFP)$$

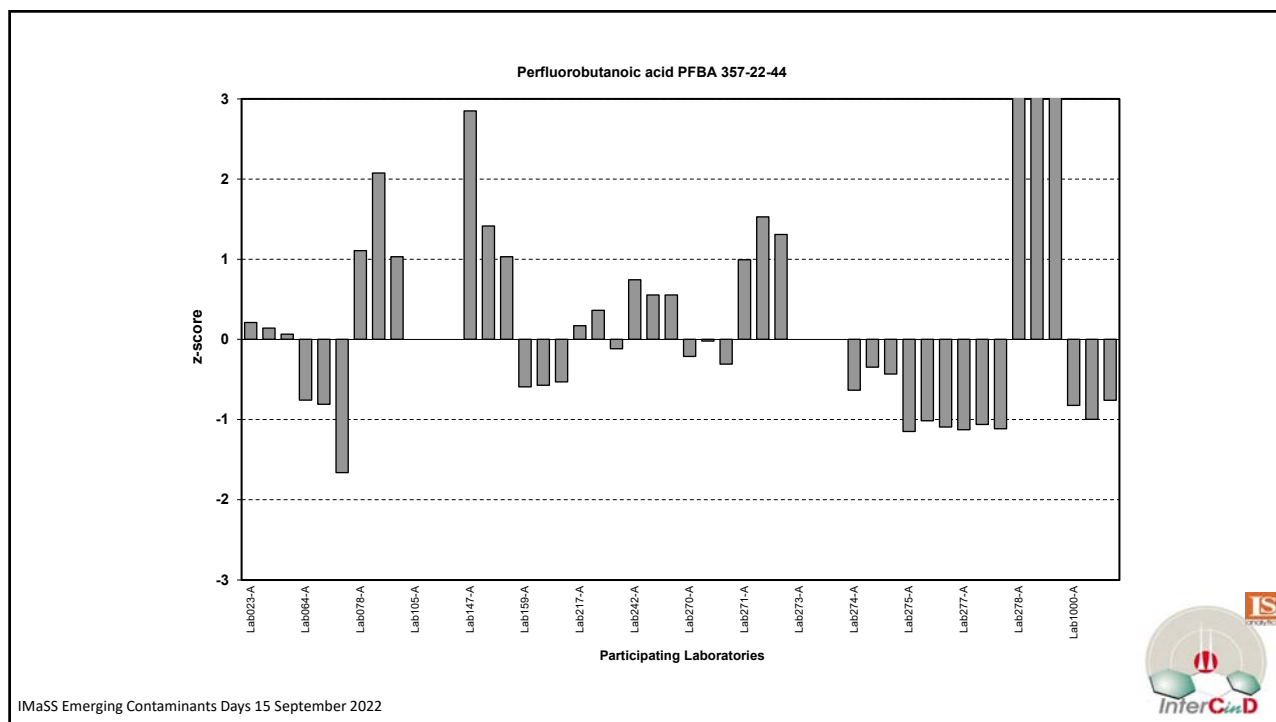

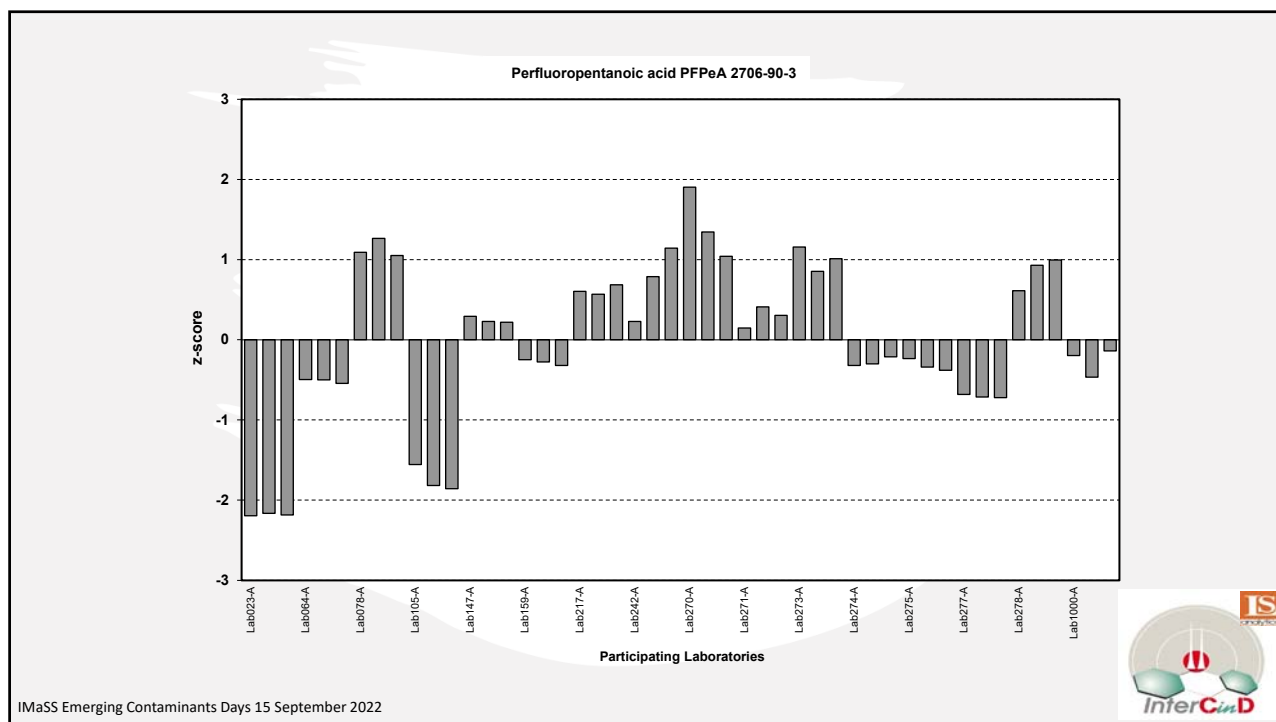

Where:

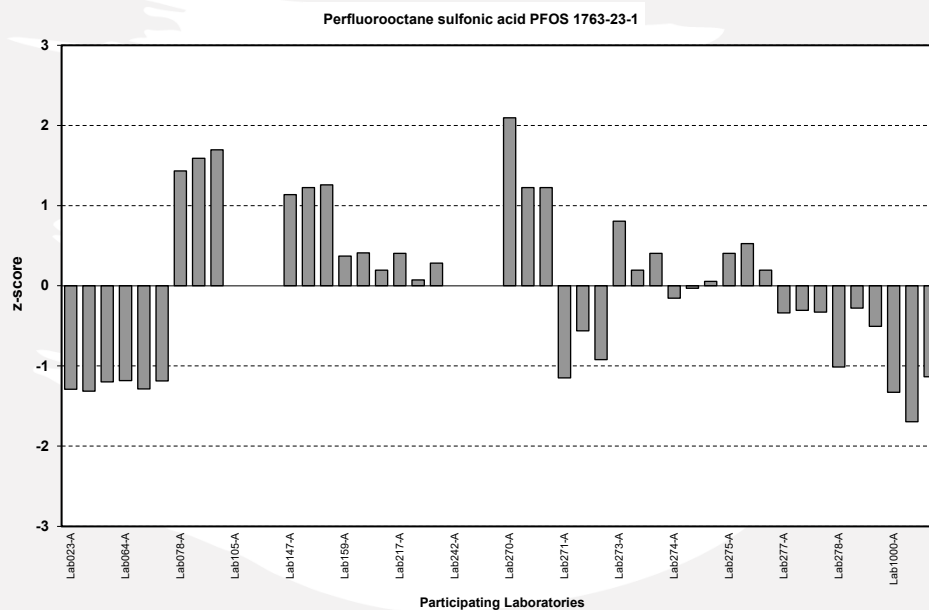

$|z| \leq 2.0$  are considered still of reasonable accuracy

$2.0 < |z| < 3.0$  are considered of low accuracy

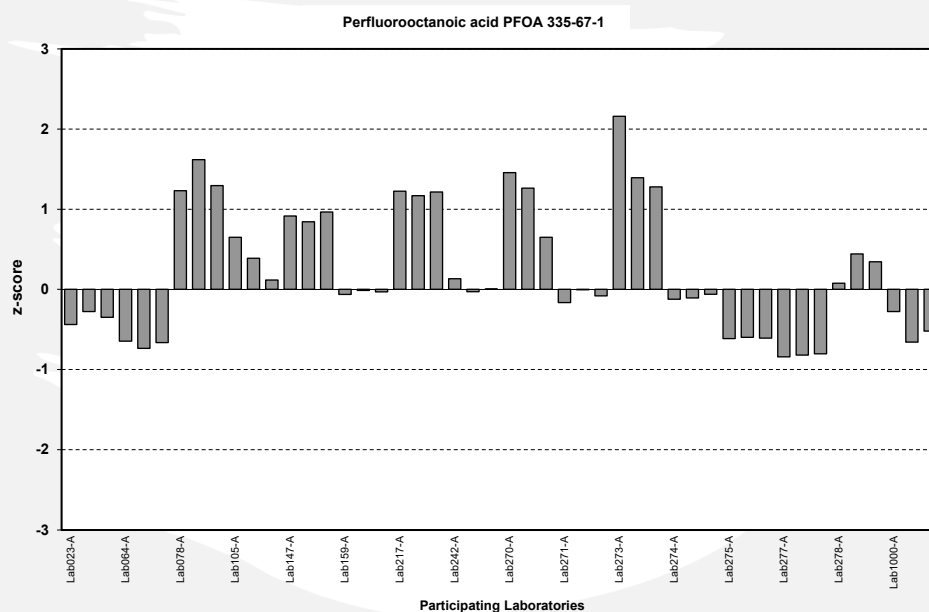

$|z| \geq 3.0$  are considered indicative of poor accuracy

IMaSS Emerging Contaminants Days 15 settembre 2022

IMaSS Emerging Contaminants Days 15 September 2022

## CONCLUSION

PTs are one of the most important tools that laboratories can must put in place to guarantee their performance.

## SEMINARIO InterCinD Annual Meeting BOLOGNA POP's DAY2022 14 OTTOBRE 2022

**TUTELA AMBIENTE:  
LA CHIMICA COME STRUMENTO PER LA  
SALVAGUARDIA E LA TUTELA DEGLI  
ECOSISTEMI NATURALI**

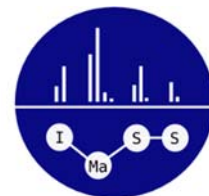

(Risultati dei PT INTERCIND)  
oltre alla

Qualità e affidabilità dei  
proficiency testing alla luce  
della norma ISO/IEC 17043:2010

Qualora la condizione  $u(x_{PT}) < 0.3 \sigma_{PT}$  non fosse rispettata, ossia  $u(x_{PT}) > 0.3 \sigma_{PT}$ , il calcolo di z-score avviene con un'altra relazione:

$$z' = (x_i - x_{PT}) / \sqrt{(\sigma_{PT}^2 + u(x_{PT})^2)}$$

*Evaluation of perfluoroalkyl acids uptake by  
hydroponic crops and emerged macrophytes: from  
extraction to LC-MS/MS determination*

# Objectives

1. Evaluation of PFAAs model uptake by different hydroponic crops
2. Assessment of PFAAs uptake by aquatic macrophytes

Estimation of human  
exposure to PFAAs through  
food chain

Assessment of wastewater  
phytoremediation by selected  
plants

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## Experimental set-up

- Unheated greenhouse
- T and U% monitoring
- Two hydroponic tests sessions (leafy crops)
- Constructed wetlands mesocosm (emerged aquatic macrophytes)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

# Experimental set-up

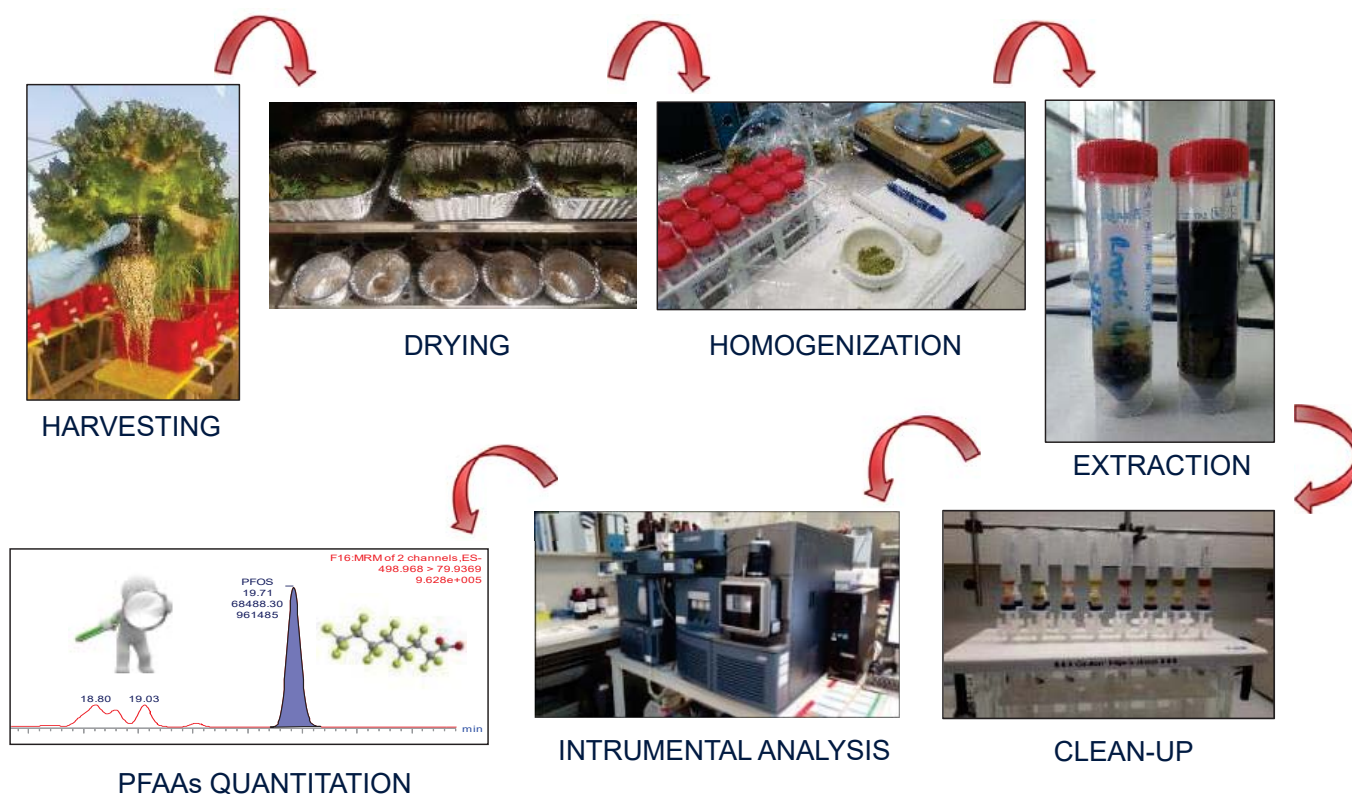

- Plants were exposed to PFAAs spiked solutions and wastewaters
- Tested waters were added of nutrients (N, P, K, Ca, Mg,...)

- Determination of PFAAs concentration in roots and leaves
- Determination of bioaccumulation factors (RCF, LCF, TF)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## Experimental set-up: PFAAs determination

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

# Plant uptake evaluation

- PFAAs concentration in leaves and roots

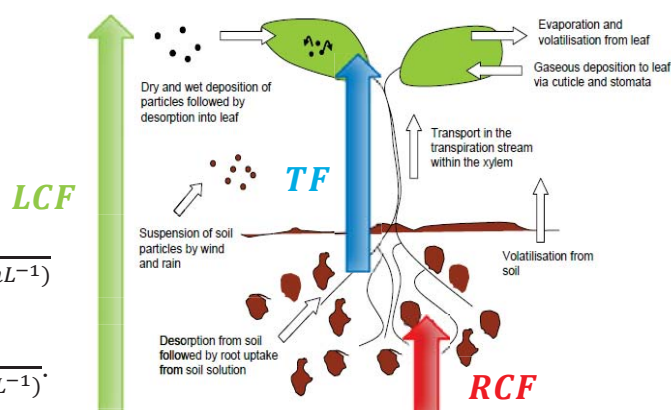

- Vegetation biomass

- Bioconcentration factors:

$$RCF = \frac{\text{PFAA concentration in roots (ng g}_{dw}^{-1})}{\text{PFAA concentration in nutrient solution (ng mL}^{-1})}$$

$$LCF = \frac{\text{PFAA concentration in leaves (ng g}_{dw}^{-1})}{\text{PFAA concentration in nutrient solution (ng mL}^{-1})}$$

$$TF = \frac{\text{PFAA concentration in leaves (ng g}_{dw}^{-1})}{\text{PFAA concentration in roots (ng g}_{dw}^{-1})}$$

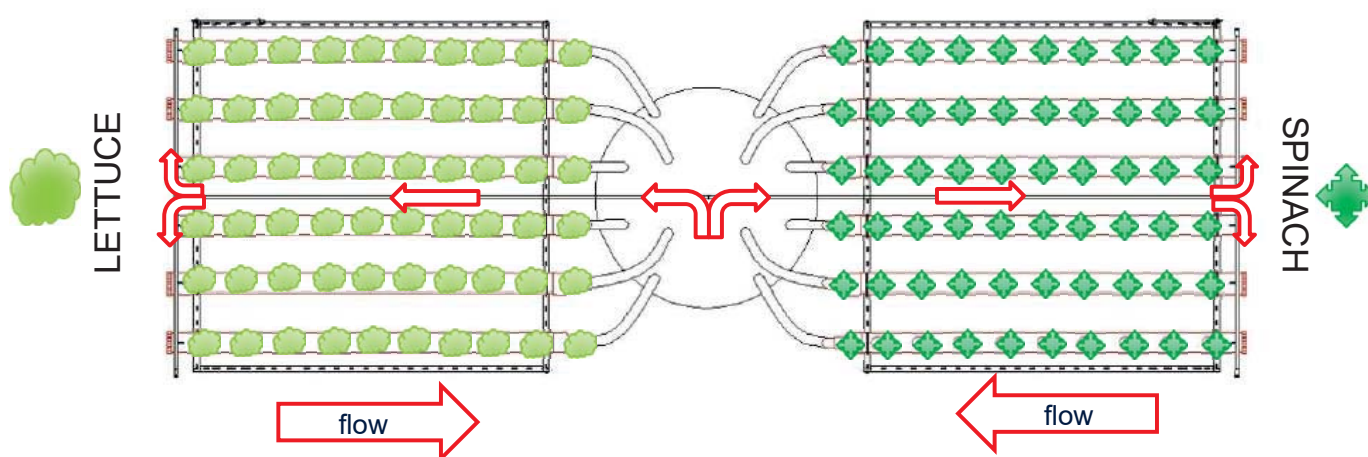

Principal pathways for plant uptake of organic chemicals from  
«Evaluation of models for predicting plant uptake of chemicals from soil»  
(Collins et al., 2006)

- PFAA concentration in water (nutrient solution) and substrate
- No loss of PFAAs degradation or volatilization was considered

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## Hydroponics: scheme

- Two test sessions (oct – dec 2019, feb – apr 2020)
- All batches hosted 120 plants, 60 plants per horticultural species
- 12 plants per crop species and per batch were analyzed

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

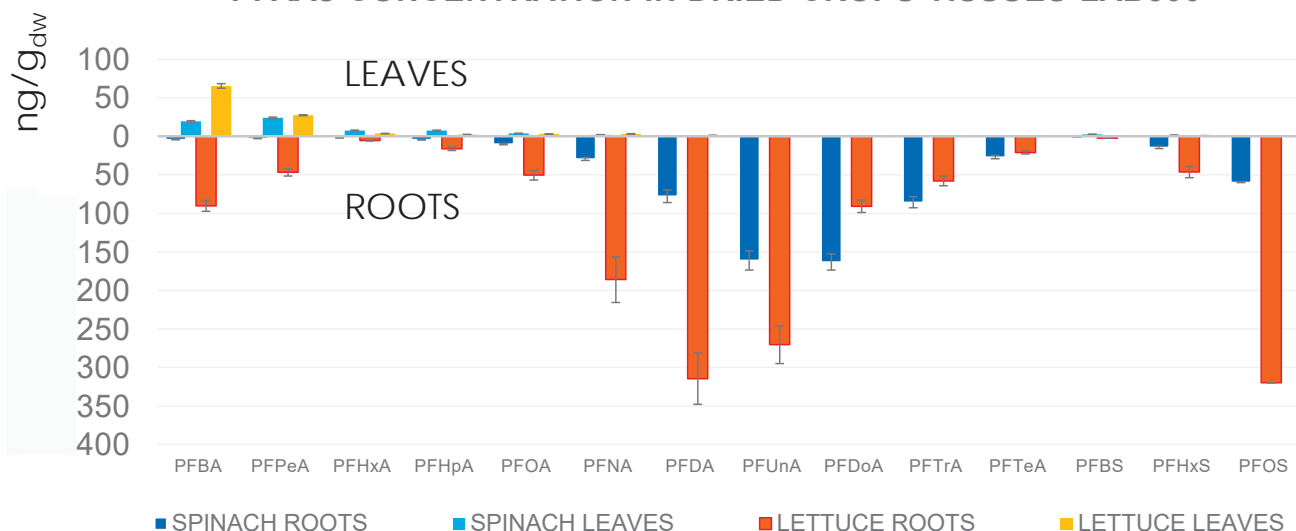

# Hydroponics: tested waters

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## Hydroponics: results

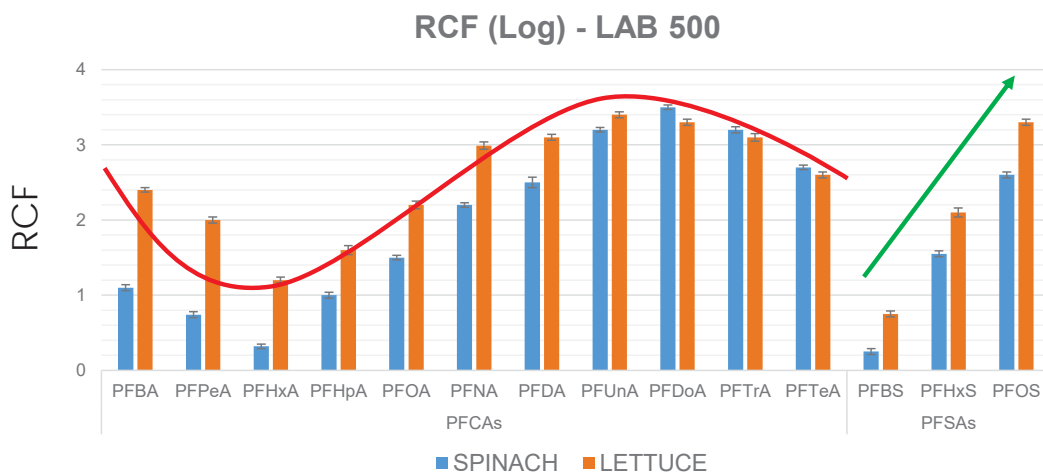

PFAAs CONCENTRATION IN DRIED CROPS TISSUES LAB500

- Most of PFAAs concentrations in roots were higher than leaves for both crops
- Most of PFAAs concentrations in lettuce biomasses were higher than spinach

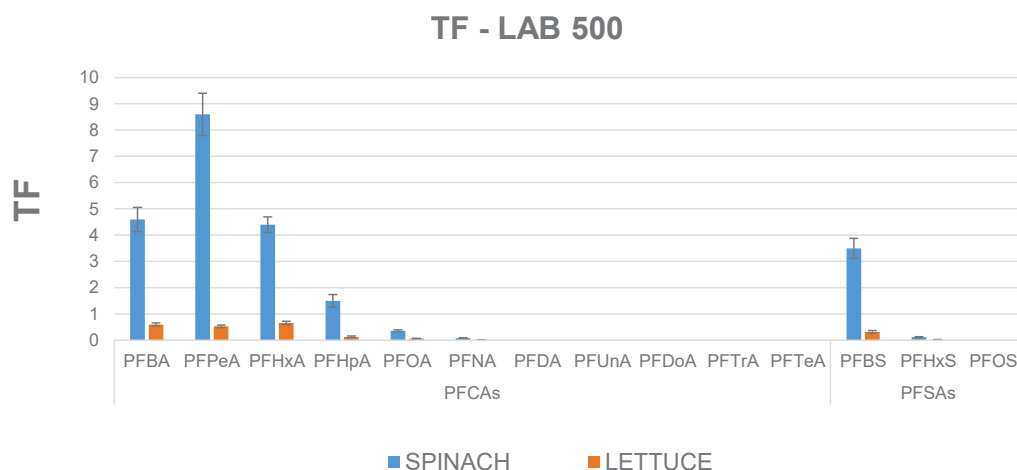

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

# Hydroponics: results

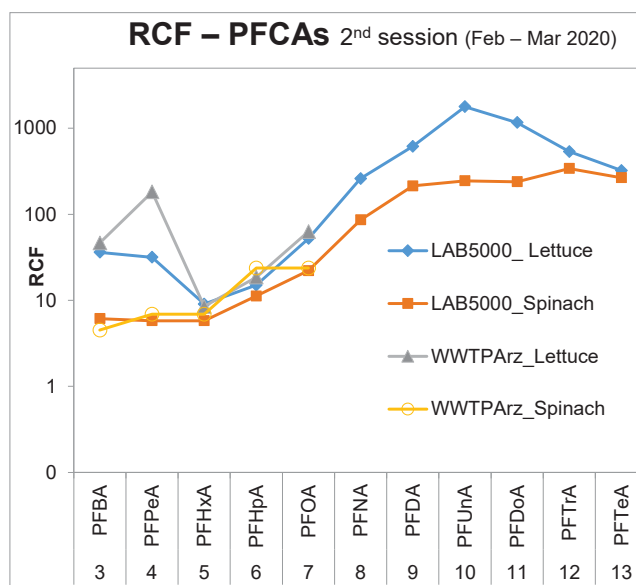

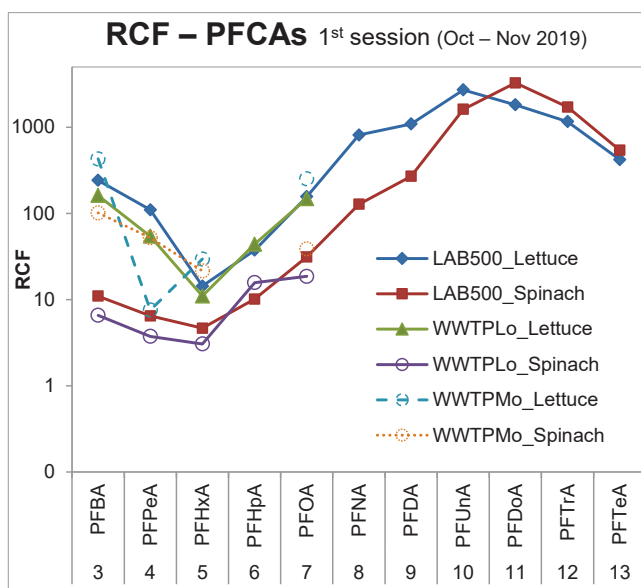

- **PFCAs RCFs**: sigmoidal pattern
- **PFSA RCFs** increased with increasing of perfluorinated chain length
- RCF lettuce > RCF spinach except from PFDoA to PFTeA

# Hydroponics: results

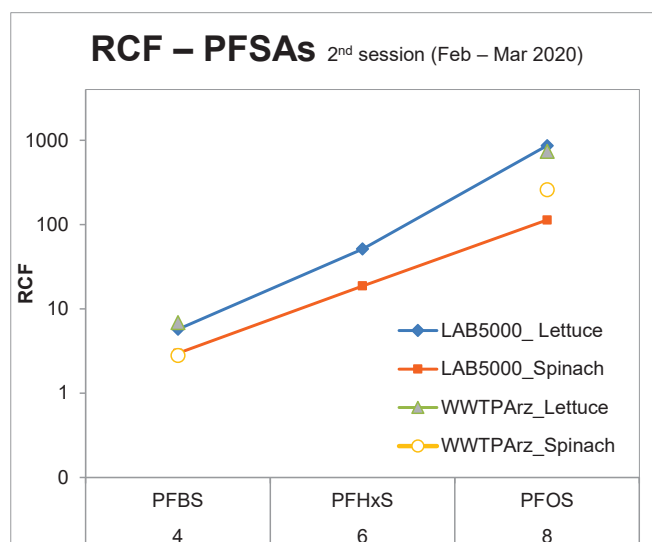

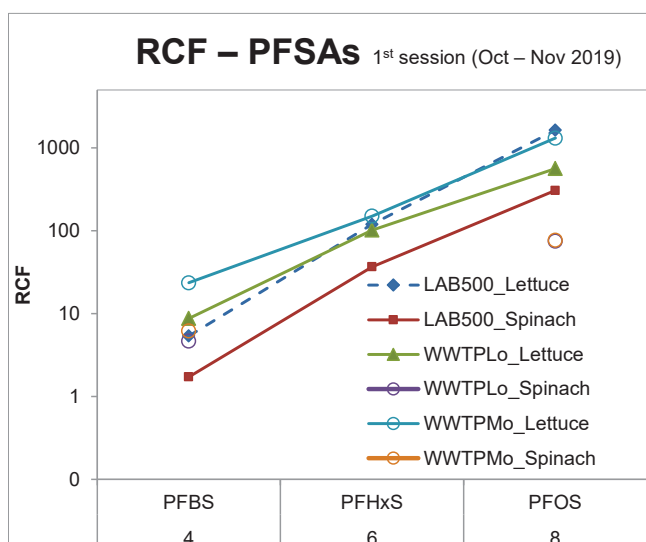

- TF value decreased with increasing perfluorinated C-chain length
- TF of spinach resulted always higher than lettuce (up to 15 times)

# Hydroponics: results

- RCF of PFCAs in WWTP showed the same pattern of LAB solutions
- PFCAs RCF values were similar among the test sessions

# Hydroponics: results

- RCF of PFSA's in WWTP showed the same pattern of LAB solutions
- PFSA's RCF values were similar among the test sessions

# Hydroponics: conclusions

- RCF of PFCAs showed a sigmoidal relationship with C-chain length
- PFSA's RCF increased with increasing of perfluorinated chain length
- TF value of all compounds was higher in spinach than lettuce
- Lettuce uptake (% PFAAs mass) was higher than spinach
- Future perspectives: fruiting crops (tomatoes, cucumbers)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## CW mesocosm: experimental set-up

- Unheated greenhouse
- Mesocosm systems → 0.56 × 0.35 × 0.31 m
- 4 plants per tank
- 6 kg expanded clay per tank
- Zero discharge system
- 55 L tot PFAA synthetic solution per tank + nutrient solution volume on request
- 248 L wastewater (WWTP) per tank
- 4 tested waters
- 3 plant species
- 3 replicates

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

# CW mesocosm: treatments

## PLANT SPECIES

*Iris pseudacorus* L.

*Typha latifolia* L.

*Phragmites australis* (Cav.) Trin. Ex Steud

## TESTED WATERS

| PFAA<br>(ng L <sup>-1</sup> ) | C-chain<br>length | TESTED WATERS |           |           |      |

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

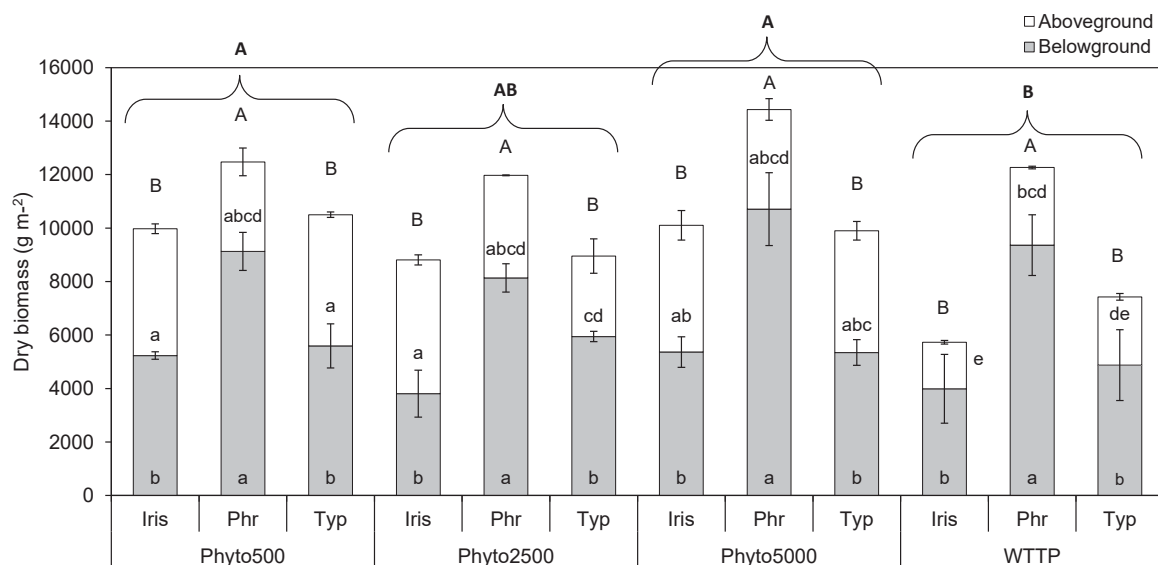

# CW mesocosm: experimental monitoring

- Exposure period → 26 feb – 5 Jul 2020
- T and U% monitoring
- Water monitoring:
  - Main nutrients (N, P, K, Ca, Mg,...) → added whether required to maintain equal concentrations
  - Physicochemical properties (weekly)
  - PFAAs concentration (weekly)
- Vegetation (end of experiment):
  - Aboveground and belowground biomass
  - PFAAs concentration
- PFAAs in porous media (end of experiment)
- PFAAs in surface plastic tank (end of experiment, 10 cm<sup>2</sup> swab)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

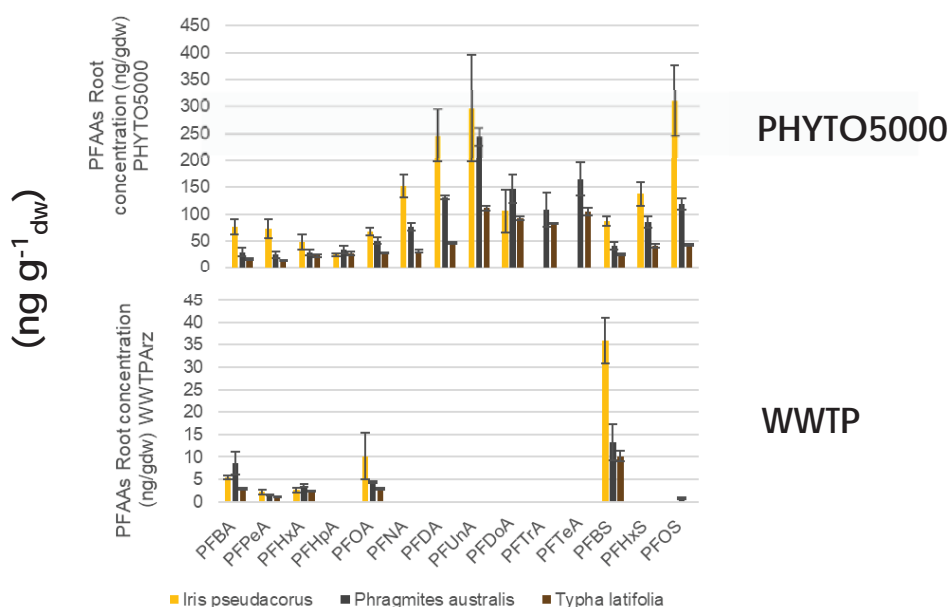

# CW mesocosm: plant biomass

- Dry biomass didn't decrease with increasing PFAAs concentration
- Dry biomass of *Iris* and *Typha* significantly decrease in WWTP treatment

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

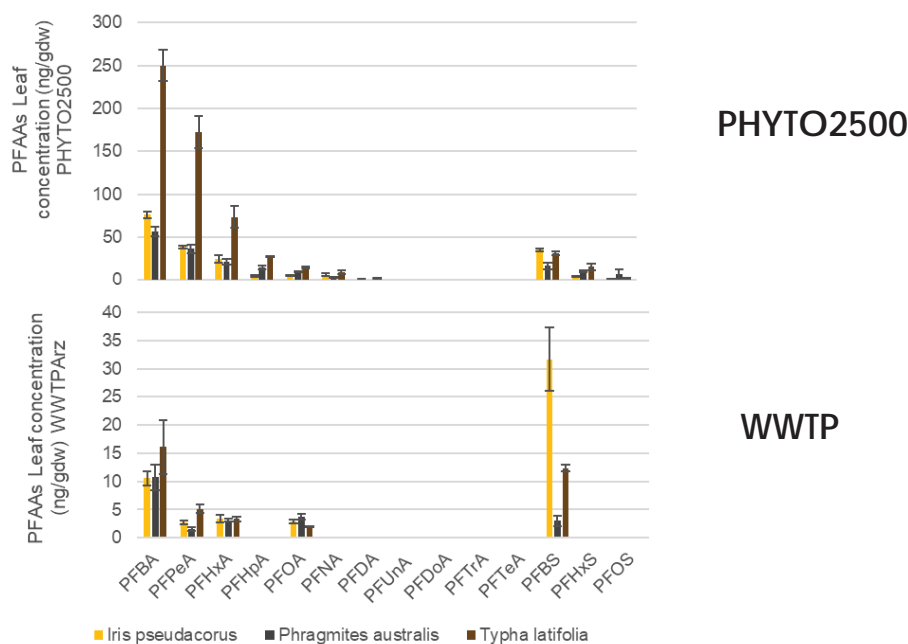

# CW mesocosm: belowground PFAAs

- PFAAs roots concentration *Iris* > *Phragmites* > *Typha* (C < 11)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

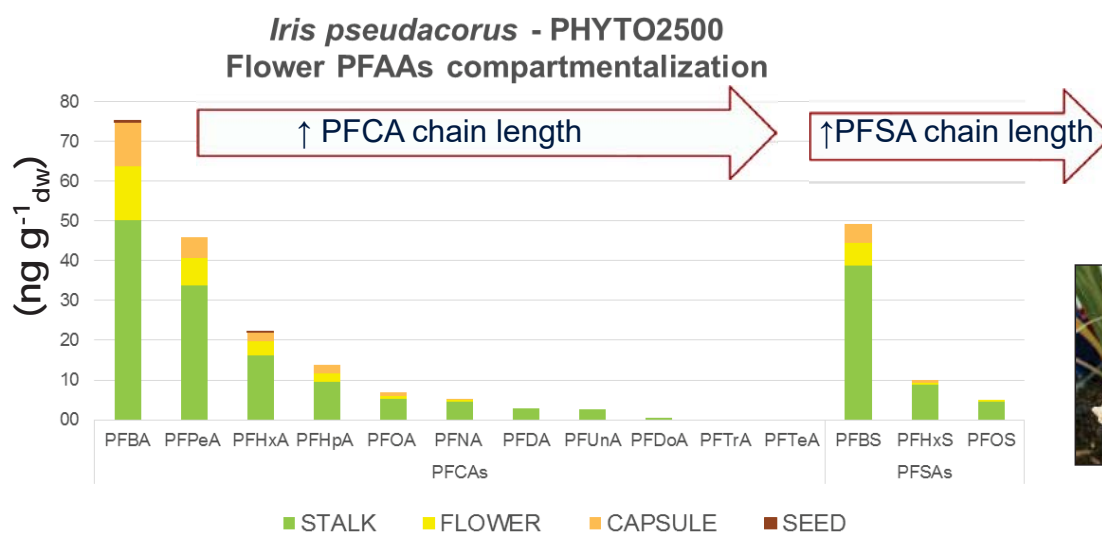

# CW mesocosm: aboveground PFAAs

- PFAAs leaves conc. decreased with increasing C-chain length
- PFAAs leaves conc. *Typha* > *Phragmites* > *Iris* (PFCAs ≤ 5)
- *Typha* showed the lowest PFSA's concentration in leaves

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

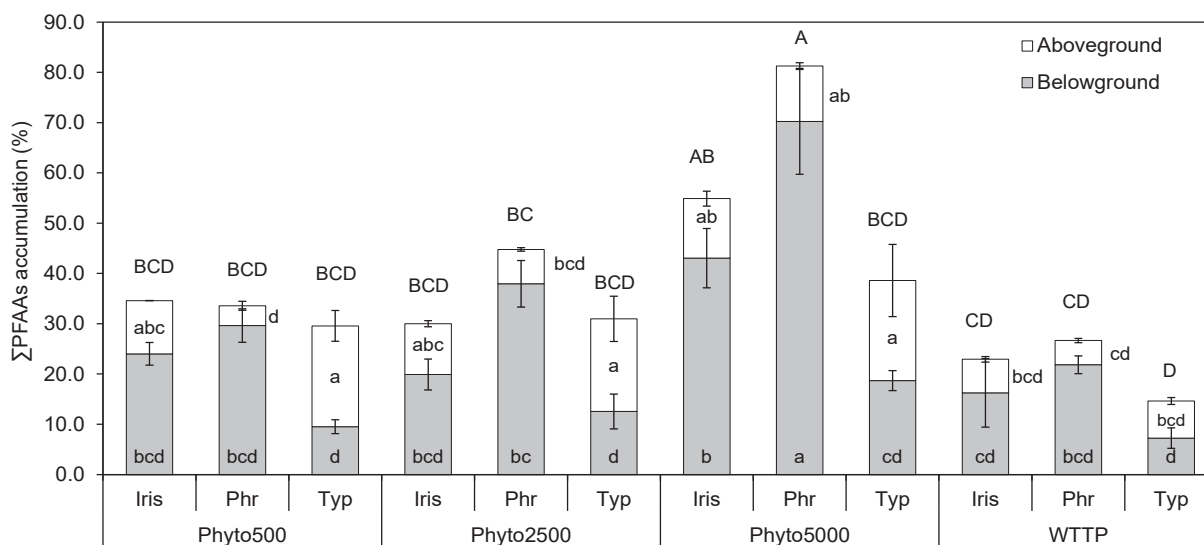

## CW mesocosm: PFAAs in *Iris* tissues

- PFAAs conc. stalk > flower > capsule > seeds
- PFAAs conc. decreased with increasing C-chain length

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## % PFAAs mass removal by plants

- Removal efficiency grew with increasing total PFAAs concentration
- % Removal generally resulted in this order: *Phragmites* > *Iris* > *Typha*
- *Typha* translocated from roots to leaves up to 67% of the total PFAAs removed
- *Phragmites* accumulated in roots up to 88% of the total PFAAs removed

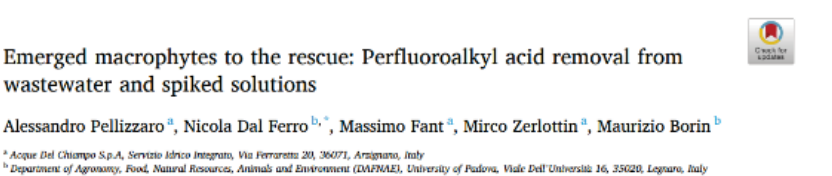

IMaSS Emerging Contaminants Days – Bologna September 15, 2023

## CW mesocosm: conclusions

- Vegetation did not suffer the increasing PFAAs concentration in spiked solutions
- Growth limitations especially occurred in *Typha* and *Iris* when they were exposed to wastewater → high total salt concentration?
- *Phragmites* had the highest total removal efficiency (from 27% to 81%) → mostly in belowground tissues
- *Typha* had the highest PFAAs removal in aboveground tissues → mainly short perfluorinated C-chain PFBA, PFPeA & PFHxA.
- Future perspectives: investigation of further matrices (sludge and leachate) and of long-term exposure to plant treatments (PFAAs re-allocation to roots?)

IMaSS Emerging Contaminants Days – Bologna September 15, 2023
